Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered. Data are available on CD, diskette, computer print-out, microfiche and microfilm, and magnetic tape. Maps and other geographic reference materials are available for some types of data. Direct on-line access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Investment and Capital Stock Division,
National Wealth and Capital Stock Section,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 951-2579) or to the Statistics Canada reference centre in:

Halifax (1-902-426-5331)	Regina (1-306-780-5405)
Montréal (1-514-283-5725)	Edmonton (1-403-495-3027)
Ottawa (1-613-951-8116)	Calgary (1-403-292-6717)
Toronto (1-416-973-6586)	Vancouver (1-604-666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland, Labrador, Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-263-1136
Saskatchewan	1-800-667-7164
Manitoba	1-800-661-7828
Alberta and Northwest Territories	1-800-563-7828
British Columbia and Yukon	1-800-663-1551

Telecommunications Device for the Hearing Impaired	1-800-363-7629
Toll Free Order Only Line (Canada and United States)	1-800-267-6677

How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Marketing Division, Sales and Service, Statistics Canada, Ottawa, K1A 0T6.

Standards of Service to the Public

To maintain quality service to the public, Statistics Canada follows established standards covering statistical products and services, delivery of statistical information, cost-recovered services and service to respondents. To obtain a copy of these service standards, please contact your nearest Statistics Canada Regional Reference Centre.

Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes. Les données sont disponibles sur disque compact, disquette, imprimé d'ordinateur, microfiche et microfilm, et bande magnétique. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordinolinguée et le système d'extraction de Statistique Canada.

Comment obtenir d'autres renseignements

Toute demande de renseignements au sujet de cette publication ou de statistiques et services connexes doit être adressée à la:

Division de l'investissement et du stock de capital,
Section de la richesse nationale et du stock de capital,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 951-2579) ou au centre de consultation de Statistique Canada à:

Halifax (1-902-426-5331)	Regina (1-306-780-5405)
Montréal (1-514-283-5725)	Edmonton (1-403-495-3027)
Ottawa (1-613-951-8116)	Calgary (1-403-292-6717)
Toronto (1-416-973-6586)	Vancouver (1-604-666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

Note of Appreciation

*Canada owes the success of its statistical system to
a long-standing cooperation involving Statistics
Canada, the citizens of Canada, its businesses,
governments and other institutions. Accurate and
timely statistical information could not be produced
without their continued cooperation and goodwill.*

Note de reconnaissance

*Le succès du système statistique du Canada repose
sur un partenariat bien établi entre Statistique Canada
et la population, les entreprises, les administrations
canadiennes et les autres organismes. Sans cette
collaboration et cette bonne volonté, il serait impossible
de produire des statistiques précises et actuelles.*

Symbols

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential.

NOTE ON CANSIM

CANSIM (Canadian Socio-Economic Information Management System) is Statistics Canada's computerised data bank and its supporting software. Most of the data appearing in this publication are available from CANSIM via terminal, on computer printouts, or in machine readable form. Matrix numbers are given in Text Table 1.

For further information, write to CANSIM, Dissemination Division, Statistics Canada, Ottawa, K1A 0T6 or telephone (613) 951-8200.

This publication was prepared under the direction of:

P. Koumanakos, Director, Investment and Capital Stock Division

R. Landry, Chief, National Wealth and Capital Stock Section

P. Gaudreau, National Wealth and Capital Stock Section

K. Huang, National Wealth and Capital Stock Section

R. Krakower, National Wealth and Capital Stock Section

S. Wood, National Wealth and Capital Stock Section.

The paper used in this publication meets the minimum requirements of American National Standard for Information Sciences — Permanence of Paper for Printed Library Materials, ANSI Z39.48 — 1984.

Signes conventionnels

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. chiffres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- valeurs infimes.
- P chiffres provisoires.
- r chiffres rectifiés.
- x confidentiel.

NOTE CONCERNANT CANSIM

Le CANSIM (Système canadien d'information socio-économique) est le système de Statistique Canada qui se compose d'une banque de données informatisées et de son logiciel de soutien. La plupart des données présentées dans cette publication peuvent être extraites du CANSIM par l'intermédiaire d'un terminal, sous forme d'imprimées d'ordinateur ou sous forme lisible par machine. Les numéros de matrice apparaissent au tableau explicatif 1.

Pour plus de renseignements écrivez à CANSIM, Division de la diffusion, Statistique Canada, Ottawa, K1A 0T6 ou téléphonez à (613) 951-8200.

Cette publication a été rédigée sous la direction de :

P. Koumanakos, Directeur, Division de l'investissement et du stock de capital

R. Landry, Chef, Section de la richesse nationale et du stock de capital

P. Gaudreau, Section de la richesse nationale et du stock de capital

K. Huang, Section de la richesse nationale et du stock de capital

R. Krakower, Section de la richesse nationale et du stock de capital

S. Wood, Section de la richesse nationale et du stock de capital.

Le papier utilisé dans la présente publication répond aux exigences minimales de l'American National Standard for Information Sciences — "Permanence of Paper for Printed Library Materials", ANSI Z39.48 — 1984.

Acknowledgements

The National Wealth and Capital Stock Section of the Investment and Capital Stock Division sincerely thanks all those who contributed to the Capital Stock Survey Project. Those mentioned below were particularly instrumental in the successful outcome of the project.

The Bank of Canada, the Department of Finance and the Economic Council of Canada helped define and launch the project. The Capital Expenditures Section of the Investment and Capital Stock Division gathered the investment and capital stock data necessary to produce the revised estimates. The Research and Development Section of the Division contributed to the research and analysis of the new data.

Remerciements

La Section de la richesse nationale et du stock de capital de la Division de l'investissement et du stock de capital remercie sincèrement tous ceux qui ont contribué au projet d'enquête sur le stock de capital. Elle est notamment redevable de la réussite du projet envers les collaborateurs suivants.

La Banque du Canada, le ministère des Finances et le Conseil économique du Canada ont aidé à définir et à lancer le projet. La section des dépenses en capital de la Division de l'investissement et du stock de capital a recueilli les données sur l'investissement et le stock de capital nécessaires à la production des prévisions révisées. La Section de la recherche et du développement de la Division a contribué à la recherche et à l'analyse des données nouvelles.

Flux et stocks de capital fixe domiciliaire – Canada	300
Bibliographie	301

Introduction

In the more than ten years since the last historical capital stock publication was released in 1983, there have been major developments in the evolution of Canadian capital stock data. This publication presents revised historical capital stock estimates calculated using a new and improved methodology. In addition, in order to facilitate the use of the data, readers will find an overview of the subject of capital stocks, a detailed description of the methodology used in the calculation of the estimates and a summary of some of the most important applications of the data.

The capital stock data in this publication incorporate the new information collected on the Capital and Repair Expenditures Survey that was revised in 1985 and 1987 and provides periodic benchmarks of the capital stock in place to complement the estimates produced by the perpetual inventory method. The survey measures both stocks and flows and thus provides an integrated method for measuring capital stocks.

The survey provided valuable new information on the decline in service lives, the pattern of discards, and depreciation. This is important in assessing the impact of rapid technological progress and increased competitive pressures on the level of the value of the capital stock by industry.

In addition, the expanded range of data from the revised survey can be used in many types of analysis related to investment and capital stock. For example, various types of production functions can be constructed to explain why methods of production differ both within and across industries and countries. Productivity and competitiveness and their impacts on living standards can be measured.

Moreover, sources and rates of technological progress can be analysed and the degree of automation between industries and countries can be compared. Macroeconomic and microeconomic policy-makers can be guided by estimates of capacity utilization and potential output. Estimates of depreciation can be used to support decisions on tax policy. Capital intensity by industry can be calculated, thereby shedding light on sectoral investment needs. Leased capital can be allocated to its industry of use as opposed to industry of ownership. Capital expenditures by industry on pollution abatement can be identified.

Section I of this publication gives a brief overview of the capital stock data outlining their importance for economic analysis. Section II explains the methodology for calculating capital stock in some detail. Section III discusses the applications of the capital stock data in economic analysis including: production functions; productivity and competitiveness; technological progress; automation; potential output; capacity utilization; depreciation for tax policy; wealth; capital intensity by industry; leasing; and pollution abatement.

Introduction

Il s'est écoulé maintenant plus de dix ans depuis la dernière publication historique sur le stock de capital, en 1983, et les données sur le stock de capital du Canada ont subi d'importantes transformations. Cette publication fait le point sur cette question. Elle contient des données historiques révisées qui ont été calculées grâce à une nouvelle méthodologie améliorée. Afin de faciliter l'utilisation des données sur le stock de capital, cette publication présente une vue générale de celles-ci, expose en détail la méthodologie utilisée et résume quelques-unes des principales applications des données en question.

Les données sur le stock de capital présentées ici incorporent les nouveaux renseignements recueillis lors de l'Enquête sur les dépenses en immobilisations et en réparations qui a été révisée en 1985 et 1987 et qui fournit des repères périodiques du stock de capital en place pour compléter les estimations recueillies par la méthode de l'inventaire permanent. L'enquête mesure les stocks et les flux et constitue donc une méthode intégrée de mesure du stock de capital.

L'enquête fournit de nouveaux renseignements précieux sur la baisse de la durée de vie utile, la nature des mises hors service et l'amortissement. Ces renseignements sont importants si l'on veut évaluer l'impact de la rapidité du progrès technologique et de l'augmentation des pressions concurrentielles sur le niveau de la valeur du stock de capital par branche d'activité.

Les nouvelles données provenant de l'enquête peuvent servir à de nombreuses applications, telles que l'estimation des différents types de fonctions de production pour expliquer pourquoi les méthodes de production diffèrent à l'intérieur et entre les branches d'activité et les pays, la mesure de la productivité et de la compétitivité et l'évaluation de leur impact sur le niveau de vie.

De même, les nouvelles données jouent un rôle très important dans l'estimation du progrès technologique et l'analyse de ses causes, la comparaison du degré d'automatisation entre les branches d'activité et les pays, l'élaboration des estimations de la production potentielle et de l'utilisation de la capacité pour guider la gestion macro-économique et la prise de décisions micro-économiques, la fourniture d'estimations de l'amortissement afin d'appuyer l'élaboration des politiques fiscales, le calcul de l'intensité de capital par secteur d'activité et la détermination des besoins en investissements sectoriels, l'affectation du capital loué à la branche d'activité d'utilisation et l'identification des dépenses au titre de la réduction de la pollution par branche d'activité.

Dans la section I de cette publication, on trouve une brève vue d'ensemble des données sur le stock de capital, décrivant leur importance pour l'analyse économique. Dans la section II, on explique la méthodologie utilisée pour calculer le stock de capital en détail. La section III examine les applications des données sur le stock de capital dans l'analyse économique, ce qui comprend les fonctions de production, la productivité et la compétitivité, le progrès technologique, l'automatisation, la production potentielle, l'utilisation de la capacité, l'amortissement pour politique fiscale, la richesse, l'intensité de capital par branche d'activité, le crédit-bail et la réduction de la pollution.

Vue générale

Overview

Importance of Capital Stock Estimates

How large is Canada's capital stock? How fast is it growing? How productive are the individual industrial sectors? What is the average age of the capital stock for these industries? Is fast-changing technology accelerating the obsolescence of the capital stock? These questions can be answered directly using the capital stock data published by Statistics Canada. Given the widespread relevance of capital stock data in economic analysis, it is vitally important that the data be accurate.

Reliable estimates of productivity, capacity utilization and potential output, which are important for macroeconomic management, depend on high-quality capital stock data. Measures of capacity utilization help policy-makers to identify bottlenecks in industry where price pressures are likely to emerge. Productivity estimates are necessary to measure efficiency, and are important indicators of competitiveness. Estimates of potential output are often used in conjunction with economic forecasts as a guide for stabilization policies.

The evaluation of tax policies also depends on accurate capital stock data. Although public policy can sometimes favour one industry or asset type over another, as a general rule, the best corporate tax policy is one that is neutral and imposes the same tax burden on all industries. Higher tax burdens on some industries and assets create distortions resulting in misallocations in capital and lower output and productivity. To ensure that the corporate tax is neutral requires good estimates of economic depreciation and service lives that can be used in setting capital cost allowances for tax purposes. Capital stock estimates by industry also provide useful information in determining the cost of, and need for, investment tax credits.

In the international sphere, capital stock data also help guide policy. Productivity and cost comparisons provide an indication of the ability of industries to compete in international markets. Such information can be useful in gauging the likely impact of trade liberalization. Capacity utilization measures are also important in determining the ability of industries to increase output when faced with increases in export demand. For an industry that was operating at full capacity, for example, a fall in the exchange rate would not have an immediate positive impact on output, but might instead give rise to inflationary pressures.

Vue générale

Importance des estimations du stock de capital

Quelle est l'importance du stock de capital du Canada? À quelle vitesse croît-il? Quelle est la productivité des divers secteurs d'activité? Quel est l'âge moyen du stock de capital pour ces branches d'activité? Une technologie en évolution rapide accélère-t-elle l'obsolescence du stock de capital? Il est possible d'avoir une réponse directe à ces questions en utilisant les données que publie Statistique Canada. Compte tenu de la pertinence générale de ces données dans l'analyse économique, il est essentiel qu'elles soient exactes.

Des estimations fiables de la productivité, de l'utilisation de la capacité et de la production potentielle, qui sont importantes pour la gestion macro-économique, dépendent de données sur le stock de capital qui soient de haute qualité. Les mesures de l'utilisation de la capacité aident les décideurs à déterminer les goulots d'étranglement dans l'industrie, lorsque des pressions sur les prix vont probablement apparaître. Les estimations pour la productivité sont nécessaires à la mesure de l'efficacité et sont d'importants indicateurs de la compétitivité. Les estimations de la production potentielle sont souvent utilisées conjointement avec les prévisions économiques pour guider les politiques de stabilisation.

L'évaluation des politiques fiscales dépend de la précision des données sur le stock de capital. Bien que la politique publique puisse parfois favoriser une branche d'activité ou une catégorie d'actifs par rapport à une autre, en règle générale la meilleure politique fiscale pour les sociétés est celle qui est neutre et qui impose le même fardeau fiscal à toutes les branches d'activité. Des fardeaux fiscaux plus élevés sur certaines branches d'activité et certains actifs entraînent des distorsions qui se traduisent par une mauvaise répartition du capital et une baisse de la production et de la productivité. Afin de garantir la neutralité de l'impôt sur le revenu des sociétés, il faut disposer de bonnes estimations de la dépréciation économique et de la durée de vie utile qui peuvent servir à déterminer les provisions pour consommation de capital aux fins fiscales. Les estimations du stock de capital par branche d'activité fournissent également des renseignements utiles pour déterminer le coût et la nécessité des crédits d'impôt à l'investissement.

Sur le plan international, les données sur le stock de capital peuvent également aider à guider les politiques. La comparaison de la productivité et des coûts fournit une indication de la capacité des branches d'activité à entrer en concurrence sur les marchés internationaux. De tels renseignements peuvent se révéler utiles lors de l'évaluation de l'impact probable de la libéralisation du commerce. Les mesures d'utilisation de la capacité sont également importantes quand il s'agit de déterminer la capacité des branches à accroître la production lorsqu'elles font face à une augmentation de la demande à l'exportation. Dans le cas d'une branche d'activité qui fonctionne à pleine capacité, par exemple, une diminution du cours du change n'aurait pas un effet positif immédiat sur la production, mais pourrait plutôt se traduire par une augmentation des pressions inflationnistes.

Estimates of capital stock can shed light on the investment needs of individual industrial sectors and on the industries that offer the greatest economic potential. Banks and other financial institutions can make use of such information in determining the need for financing.

The capital stock is an important component of national wealth. In Canada, it accounts for approximately 15 % of total assets, and for 38 % of all tangible assets. Capital stocks make a critical contribution to economic growth because of the integral role of capital investment in embodying new technologies, which in turn allow the production of new products, and of new, more efficient, production processes.

Methodology for Measurement of Capital

Capital stocks are reproducible tangible assets that are used as factors of production in combination with other factor inputs such as labour, energy and other natural resources or materials. The stock of capital consists of: building construction, such as plants and offices; engineering construction, such as roads and dams; and machinery and equipment used in the production process. These are distinguished from non-reproducible assets such as land, mineral deposits and natural resources, which are not produced but are directly incorporated in the production of other commodities.

Although capital stocks by industry can be measured in a variety of ways such as surveys of physical stock or of book values, the method traditionally used by Statistics Canada is the perpetual inventory method. This method, which is a flexible way to develop time series of capital stocks, accumulates investment expenditures by industry to obtain estimates of capital stock in any particular year. It requires information on the value of investment, price indices for capital goods, service lives, and methods of depreciation. The essence of the perpetual inventory method is to add gross fixed capital formation to the capital stock each year and to subtract depreciation. The Capital and Repair Expenditures Survey provides periodic benchmarks of the stock of capital actually in place, that supplement the perpetual inventory method. A detailed discussion of the methodology for estimating capital stocks is provided in Section II.

Findings on the State of Capital Stock

The revisions to the Capital and Repair Expenditures Survey led to important findings on the state of capital stock:

- Service lives have been gradually shortening over time.
- Since companies had been replacing their capital stock at a faster rate than the old methodology assumed, the newly calculated level of capital stock was lower, particularly in the agriculture, trade, manufacturing, forestry, fishing and mining industries.

Les estimations du stock de capital permettent d'obtenir des renseignements sur les besoins en investissements des différents secteurs d'activité ainsi que sur les branches d'activité qui offrent le potentiel économique le plus élevé. Les banques et les autres institutions financières peuvent également se servir de cette information lorsqu'il s'agit de déterminer le besoin de financement.

Le stock de capital est une importante composante de la richesse nationale. Au Canada, il représente environ 15 % du total de l'actif et 38 % de tous les actifs corporels. Le stock de capital joue un rôle essentiel dans la croissance économique en raison du rôle intégral des dépenses d'investissement pour l'incorporation de nouvelles technologies, qui à leur tour permettent la production de nouveaux produits et l'adoption de procédés de production nouveaux et plus efficaces.

Méthodologie de la mesure du capital

Le stock de capital est constitué d'actifs corporels reproductibles qui servent de facteurs de production en combinaison avec d'autres facteurs tels que le travail, l'énergie et les autres ressources naturelles ou matériaux. Le stock de capital comprend : les bâtiments, tels que les usines et les immeubles à bureaux, les travaux de génie, comme les routes et barrages, et enfin, les machines et le matériel, qui servent au processus de production. On les distingue des actifs non reproductibles comme la terre, les dépôts minéraux et les ressources naturelles, qui ne sont pas produits mais qui sont incorporés directement à la production des autres biens.

Il est possible de mesurer le stock de capital par branche d'activité de diverses façons, comme par exemple des enquêtes du stock matériel ou des valeurs comptables, mais Statistique Canada emploie en règle générale la méthode de l'inventaire permanent. Cette dernière, qui est un moyen facile d'élaborer des séries chronologiques des stocks de capital, cumule les dépenses d'investissement par branche d'activité pour obtenir les estimations du stock de capital pour une année donnée. À cette fin, il faut disposer de renseignements sur la valeur des investissements, les indices de prix pour les biens d'équipement, la durée de vie utile et les méthodes de dépréciation. La méthode de l'inventaire permanent consiste essentiellement à ajouter la formation brute de capital fixe au stock de capital chaque année et de soustraire l'amortissement. L'Enquête sur les dépenses en immobilisations et en réparations fournit des repères périodiques du stock de capital en place qui complètent la méthode de l'inventaire permanent. On trouve à la section II un examen détaillé de la méthodologie qui sert à estimer les stocks de capital.

Conclusions concernant la situation du stock de capital

Les révisions apportées à l'Enquête sur les dépenses en immobilisations et en réparations ont permis de dégager des conclusions importantes concernant l'état du stock de capital :

- La durée de vie utile s'est réduite progressivement avec le temps.
- Comme les firmes remplacent leur stock de capital à un rythme plus rapide que l'ancienne méthodologie ne le supposait, le nouveau niveau calculé du stock de capital est plus bas, en particulier dans les branches de l'agriculture, du commerce, de la fabrication, des forêts, de la pêche et des mines.

- Discard patterns of old capital assets vary because of premature retirements due to technological change, changes in factor prices and the retention of fully depreciated assets.
- Depreciation rates were close to geometric for both the manufacturing and non-manufacturing sectors, although the fall in efficiency is more rapid for the manufacturing sector.
- La mise hors service des actifs de nature capitale anciens varie en raison des retraits anticipés imputables à l'évolution technologique, aux variations de prix des facteurs et à la conservation d'actifs entièrement amortis.
- Les taux d'amortissement sont proches des taux géométriques pour le secteur de la fabrication et le secteur hors fabrication, bien que la baisse de l'efficacité soit plus rapide dans le premier cas.

Section II

Methodology

Section II

Méthode

Methodology

New Estimates of Service Lives

Starting with the 1985 Actual Survey of Capital and Repair Expenditures, questions are being asked about the expected service life of assets acquired during the year. In most cases, the new estimates of service lives are shorter than the old ones and much closer to the average service lives used in the other OECD countries. The assumption made in introducing the new lives, is that service lives have been gradually declining as of some date in the past when the old lives were applicable, to their present new values. Thus a major change, believed to be more realistic, has been the abandonment of the practice generally followed internationally of assuming constant service lives.

A 1987 benchmark total of the value of fixed assets was arrived at by supplementing values of stocks of fixed assets reported on the survey with those appearing on administrative records (tax data) in order to complete the survey coverage. This benchmark was used to infer lives in order to assess the overall reliability of the new life patterns selected. On average, the assumed service lives resembled the actual lives of company assets (making allowances for benchmark biases as referred to in the Appendix).

The new capital stock series were calculated using the new estimates of service lives just described. It was decided to introduce the new service life estimates in the following way:

- new surveyed lives starting in 1987
- geometric interpolation over the years prior to 1987.

For a detailed description of the technique used to introduce the new lives, please refer to item 8 in the appendix.

This pattern of introduction of the new lives was adopted because it gave results which most closely approximated reported benchmark values of fixed assets and it appeared to be the most neutral assumption, given the limited amount of related information.

Discard Pattern

To take into account that similar assets are discarded at different ages, a bell-shaped distribution of discards has been adopted. The simultaneous exit method used previously is operationally convenient and approximates the bell-shaped function since it is merely the mean of that function.

The main difference between the two methods is that the bell-shaped function produces a smoother growth pattern. With the simultaneous exit discard function, all assets of a given vintage are retained in the capital stock for their full service life (L years), and then discarded. This characteristic, known as the "echo effect", is reduced by the bell-shaped discard function, since assets are discarded at various ages.

Méthode

Nouvelles estimations de la durée de vie

Depuis 1985, l'enquête sur les dépenses en immobilisations et les réparations renferme des questions sur la durée de vie des actifs acquis au cours d'une année. En règle générale, les nouvelles estimations de la durée de vie sont inférieures aux anciennes et elles se rapprochent beaucoup plus des durées de vie moyennes utilisées dans les autres pays membres de l'OCDE. Dans le cas des nouvelles durées de vie, on suppose qu'elles ont baissé progressivement à partir d'une date dans le passé, lorsque les anciennes durées de vie étaient employées, pour tomber à leur nouveau niveau actuel. Un changement majeur, considéré plus réaliste, a été l'abandon de la pratique généralement suivie sur le plan international de supposer des durées de vie constantes.

Afin de compléter l'enquête, on a calculé pour 1987 un total de référence de la valeur des immobilisations en ajoutant aux valeurs des stocks d'immobilisations déclarées dans l'enquête celles qui figuraient dans les dossiers administratifs (données fiscales). Ce total de référence a servi à déduire les durées de vie afin s'évaluer la fiabilité globale des nouveaux régimes de durées de vie choisis. En moyenne, ces durées de vie supposées ressemblent aux durées de vie réelles des actifs des sociétés, après prise en compte des biais de référence mentionnés dans l'annexe.

Les nouvelles estimations des durées de vie, que nous venons de décrire, ont servi à calculer les nouvelles séries du stock de capital. On a décidé d'utiliser les nouvelles estimations de la durée de vie comme suit :

- nouvelles estimations de la durée de vie à compter de 1987
- interpolation géométrique pour les années antérieures à 1987.

On trouvera au point 8 de l'annexe une description détaillée de la technique employée pour appliquer les nouvelles durées de vie.

On a opté pour cette façon de procéder parce qu'elle donnait les résultats les plus proches des valeurs de référence des immobilisations et parce qu'elle semblait être l'hypothèse la plus neutre, compte tenu du peu d'information connexe.

Courbe de mise hors service

Pour tenir compte du fait que des actifs semblables sont mis hors service à des âges différents, on utilise une distribution en cloche. La méthode de la sortie simultanée utilisée auparavant demeure commode; elle se rapproche de la fonction en cloche puisqu'elle correspond tout simplement à la moyenne de celle-ci.

La principale différence est que la fonction en cloche produit une courbe de croissance plus régulière puisqu'elle réduit l'effet de répercussion caractéristique de la méthode de la sortie simultanée, selon laquelle tous les actifs d'une génération donnée sont mis hors service exactement L années après leur mise en service, L correspondant à la durée de vie moyenne. L'effet de régularisation de la fonction de mise hors service en cloche signifie qu'en général,

Some assets are discarded soon after their addition to the capital stock and well before L years have elapsed. This means that, in general, when real capital formation is growing, the bell-shaped function will produce lower estimates of capital stock than the simultaneous exit function. Conversely, when real capital formation is falling, the bell-shaped function will produce higher estimates because some older assets will be retained in the capital stock for more than L years.

Beginning with the new measures introduced in 1990, a bell-shaped discard function is assumed. More precisely, the distribution adopted is a truncated bell-shaped (normal) distribution with discards distributed between 50% and 150% of the average service life (see Figure 1). This change in discard patterns gave levels and annual growth rates in the new capital stock estimates similar to those in the old estimates. Annual growth rates are less volatile using a normal distribution.

L is the average service life

Figure 1. Truncated normal distribution of asset discards

Depreciation

The pattern of depreciation of fixed assets has constantly been a research topic for economists and decision makers since Jorgenson and his collaborators made extensive use of the single geometric rate economic depreciation hypothesis (Jorgenson, 1971; Jorgenson and Griliches, 1967). Whereas discard functions assume that the efficiency of the capital asset remains the same over its entire service life, depreciation functions are formulated to take into account that efficiency declines over the service life of an asset.

lorsque la formation du capital réel est à la hausse, elle produit une estimation moins élevée du stock de capital qu'une méthode reposant sur l'hypothèse de sortie simultanée. Dans ce dernier cas, on suppose que les dernières générations d'immobilisations (qui sont aussi les plus nombreuses) demeureront intégralement L années dans le stock de capital, alors que dans la fonction en cloche, on suppose que certains éléments de ces générations ont été mis hors service. Inversement, si la formation du capital est à la baisse, une fonction en cloche produit une estimation plus élevée du stock de capital que la méthode de la sortie simultanée.

Depuis l'introduction des nouvelles mesures, en 1990, on suppose une fonction de mise hors service en cloche. Il s'agit plus précisément d'une distribution en forme de cloche (normale) tronquée, dont les limites inférieure et supérieure correspondent respectivement à 50 % et 150 % de la durée de service moyenne (voir Figure 1). Cette modification des courbes de mise hors service a abouti, dans les nouvelles estimations du stock de capital, à des niveaux et des taux de croissance semblables à ceux des anciennes estimations. Si l'on utilise une distribution normale, on obtient des taux de croissance annuelle moins irréguliers.

L est la durée de vie moyenne

Figure 1. Distribution normale tronquée des actifs mise hors service

Amortissement

Le mode d'amortissement des biens corporels a constamment fait l'objet de recherches de la part d'économistes et de décideurs depuis que Jorgenson et ses collaborateurs ont largement utilisé l'hypothèse de l'amortissement à taux géométrique unique (Jorgenson, 1971; Jorgenson et Griliches, 1967). Selon la fonction de mise hors service, l'efficacité d'une immobilisation ne change pas durant la durée de vie utile de celle-ci. La fonction d'amortissement a été établie de façon à illustrer la perte de l'efficacité au cours de la durée de vie d'un bien donné.

There are two types of depreciation, namely physical and economic depreciation. **Physical depreciation** refers to the loss in total life-time productive capacity of a physical asset due to two causes, the passage of time, and falling efficiency, that is, falling productive capacity per unit of time. **Economic depreciation** is a measure of the asset's loss in monetary value due to age at a particular date, that is, economic depreciation is the price concept corresponding to the quantity concept of physical depreciation. In one special case — geometric depreciation — physical and economic depreciation are congruent. This means that if economic depreciation is known to be geometric, then it can be inferred that physical depreciation is geometric as well (and vice versa). This unique feature of geometric depreciation lends it additional importance. If both the physical and economic depreciation patterns and the service life of an asset could be determined, the gross and net capital stocks could be estimated by the well known perpetual inventory method.

The economic depreciation pattern has been considered one of the most important factors in modern macroeconomic and tax policy models, while physical depreciation directly involves the estimate of the rental price of capital which is normally used to calculate the capital share of output.

Economic depreciation has been estimated by some researchers by examining the relationships between the ages and prices of certain types of new and used assets. For example, Ackerman (1973) studied used cars as a depreciating asset and found that the prices of used cars decline with age at a constant exponential rate. Hulten and Wykoff (1981) applied the Box-Cox power transformation to a sample of used building prices to estimate the rate and form of economic depreciation and found that the appropriate depreciation pattern is approximately geometric.

The following example, often quoted in the literature, is used to illustrate many of these different concepts.

Suppose we consider a single asset, a light bulb, whose cost when new is \$1 and which is expected to burn for 1,000 hours. Normally, a light bulb may be expected to produce the same amount of light per hour until the last hour of its useful life, and hence, after 100 hours of use, no physical depreciation will have taken place. However, only nine tenths of the expected useful life remains and therefore, assuming a discount rate of zero, the bulb's value will be 90 cents — it has undergone economic depreciation. As the bulb approaches the end of its useful life, this economic depreciation will continue but physical depreciation, defined as the decline in an asset's productive capacity per unit of time, will not occur until that hour when the bulb's productive capacity falls by an amount equal to the quantity of light per hour it had been producing — i.e. it burns out.

Many types of assets do not maintain their initial productive capacity over the course of their useful life. Let us suppose, for example, that after 300 hours of use, our light bulb's efficiency in producing light has declined, and the bulb is still burning, but not as brightly as when new. In other words, the amount of light produced per hour has decreased — physical depreciation has occurred. The value of the bulb is, in this case, less than 70 cents because the economic depreciation

On peut en fait distinguer la dépréciation de l'amortissement. La **dépréciation** désigne l'effritement, sur la durée de vie totale, de la capacité de production d'un bien corporel. Cet effritement est attribuable à deux causes : le temps et l'effritement de l'efficacité, c'est-à-dire l'effritement de la capacité de production par unité de temps. L'**amortissement** est un reflet de la perte de valeur monétaire du bien attribuable à l'âge à une date donnée. Ainsi, l'amortissement est le concept de prix qui correspond au concept de quantité de la dépréciation. Ainsi, l'amortissement est l'expression monétaire de la dépréciation. Dans un cas précis, c'est-à-dire celui de l'amortissement géométrique, elles se confondent. Lorsque l'amortissement économique est géométrique, la relation de dualité signifie que la dépréciation sera aussi géométrique (et vice versa). Cette caractéristique particulière de l'amortissement géométrique en accroît l'importance. Dans la mesure où l'on peut déterminer la dépréciation et l'amortissement ainsi que la durée de vie d'un actif, on peut aussi estimer, au moyen de la méthode bien connue de l'inventaire permanent, la valeur brute et la valeur nette du stock de capital.

L'amortissement est considéré comme l'un des facteurs les plus importants dans les modèles macro-économiques et les modèles de politique fiscale récents, tandis que la dépréciation est liée directement à l'estimation du loyer du capital qui sert normalement à calculer la portion de la production qui se rapporte au capital.

Pour estimer l'amortissement, certains chercheurs ont examiné les rapports entre l'âge et le prix de certains types d'actifs neufs et usagés. Ackerman (1973) a par exemple étudié le phénomène de l'amortissement dans le cas des voitures d'occasion et elle a observé que le prix de ces voitures diminue en fonction de l'âge à un taux exponentiel constant. Hulten et Wykoff (1981) ont appliqué la transformation de Box-Cox à un échantillon de prix d'immeubles non neufs pour estimer le taux et la forme de l'amortissement et ils ont constaté qu'il s'agissait d'un amortissement approximativement géométrique.

L'exemple suivant, souvent cité dans la littérature, permet de bien comprendre un grand nombre de ces notions différentes.

Considérons un actif unique, soit une ampoule qui est censée durer 1 000 heures et qui, neuve, coûte 1 \$. Normalement, une ampoule devrait produire la même quantité de lumière à l'heure jusqu'à la fin de sa durée de vie; par conséquent, au bout d'une centaine d'heures d'utilisation, l'ampoule n'aura subi aucune dépréciation. Cependant, il reste neuf dixièmes à la durée de vie de l'ampoule; la valeur de cette ampoule sera donc de 90 cents si l'on suppose un taux d'actualisation nul : l'actif en question a fait l'objet d'un amortissement. Et cet amortissement continue jusqu'à la fin de la durée de vie utile de l'ampoule, alors que la dépréciation, qui est définie comme l'effritement de la capacité de production d'un bien par unité de temps, ne sera constatée qu'au moment où la capacité de production de l'ampoule diminuera d'une valeur équivalente à la quantité de lumière que cette ampoule produisait à l'heure, c.-à-d. une fois que l'ampoule sera grillée.

De nombreuses catégories d'actifs ne conservent pas leur capacité de production initiale jusqu'à la fin de leur vie utile. Supposons, par exemple, qu'au bout de 300 heures d'utilisation, l'ampoule ne produit pas de la lumière avec autant d'efficacité qu'au début, c'est-à-dire qu'elle ne brille pas aussi intensément que lorsqu'elle était neuve. Autrement dit, la quantité de lumière produite à l'heure a diminué; il y a donc eu dépréciation. Dans ce cas, la valeur de l'ampoule est inférieure à 70 cents parce que l'amortissement

reflects not only the decreased useful life (there are 700 hours remaining, or seven tenths), but also the bulb's decreased efficiency.

In order to know the rate of decline in the value of existing capital goods as they age, not only are good data on average service lives and realistic discard functions required, it is also necessary to derive estimates of depreciation (capital consumption). When calculating net fixed capital formation and net fixed capital stocks, an important decision to be made is the form of depreciation to be used. As explained in the following section, our research in the area of depreciation supports the geometric form. However, it is important to recognize that measures of capital stock are needed for a variety of applications in economic and business analysis and that no single measure is appropriate for all purposes. For this reason, the new measures include estimates of net capital stocks calculated using each of the following three assumptions:

Geometric Depreciation

Using a geometric form of depreciation assumes that productive efficiency declines at a rate which accelerates with time. The geometric form reflects this by attaching a non-zero discount rate to straight-line depreciation. When the future capital services are discounted to the present year, the present value of future capital services in the early years is greater than in the later years. The present value of the capital services declines at a geometric rate since the discount factor is operating exponentially (geometrically) on the future capital services.

The price and age characteristics of used assets that were reported on the revised Capital and Repair Expenditures Survey were used to estimate the form of economic depreciation (Koumanakos and Hwang, 1993). It was found that the pattern of depreciation is close to geometric in form for both the manufacturing and non-manufacturing sectors, although the degree of convexity is more pronounced in manufacturing.

Straight-line Depreciation

Straight-line depreciation assumes that an asset's value declines in a linear fashion over its life. Under straight-line depreciation, the asset is depreciated by equal amounts each year over the life of the asset until the net value is zero.

Delayed Depreciation

This form of depreciation assumes that the decline in value occurs more in the later than in the early years. Efficiency decline as reflected in delayed depreciation is the complement of increasing repair and maintenance costs. In the case of automobiles, for example, repair and maintenance expenses reflect this form; early in the asset's life the expenses are low, but over time they increase until they reach such a level that the revenues generated by the asset do not justify them. Delayed depreciation is patterned using a beta-decay function (see the appendix for a mathematical statement).

constaté traduit non seulement la diminution de la vie utile restante (700 heures, ou les sept dixièmes), mais aussi la baisse d'efficacité de l'ampoule.

Pour connaître le rythme auquel diminue la valeur des biens corporels au fur et à mesure de leur vieillissement, il faut non seulement disposer de données fiables sur les durées de vie moyennes et de fonctions de mise hors service réalistes, mais avoir aussi des estimations de l'amortissement (consommation de capital). Lorsqu'on calcule la formation du capital fixe net et le stock de capital fixe net, il faut décider de la forme d'amortissement qu'il convient d'utiliser. Comme nous l'expliquons dans la partie suivante, notre recherche dans ce domaine privilégie l'amortissement géométrique. Il importe toutefois de reconnaître qu'il faut avoir des mesures du stock de capital pour diverses applications dans le domaine de l'analyse économique et de l'analyse des affaires et qu'il n'y a pas une seule mesure qui convient à toutes les utilisations. Pour cette raison, les nouvelles mesures incluent des estimations du stock de capital net calculées en fonction de chacune des trois hypothèses suivantes :

Amortissement géométrique

Dans les cas de l'amortissement géométrique, on suppose que l'efficacité productive diminue à un taux qui accélère avec le temps. C'est ce que traduit le fait qu'un taux d'actualisation non nul est appliqué à l'amortissement linéaire. Si les services futurs sont actualisés à l'année actuelle, leur valeur actuelle est plus élevée les premières années que par la suite et elle diminue à un taux géométrique étant donné que le facteur d'actualisation s'applique de façon exponentielle (géométrique) aux services futurs.

Pour estimer la forme de l'amortissement, on s'est servi des caractéristiques de prix et d'âge des actifs usagés déclarés lors de l'enquête sur les dépenses d'immobilisations et les réparations (Koumanakos et Hwang, 1993) (version révisée). On a constaté que l'amortissement est de type géométrique dans le secteur manufacturier comme dans le secteur non manufacturier, bien que la convexité soit plus prononcée dans le premier cas.

Amortissement linéaire

Suivant le principe de l'amortissement linéaire, la valeur d'un actif diminue de façon linéaire au cours de sa durée de vie. L'actif est donc amorti chaque année, d'un même montant, pendant toute sa durée de vie, jusqu'à ce que la valeur nette soit égale à zéro.

Amortissement différé

On suppose dans ce cas que la valeur diminue plus au cours des dernières années qu'au cours des premières. La baisse d'efficacité que traduit l'amortissement différé va de pair avec l'accroissement des frais d'entretien et de réparation. Les dépenses de réparation et d'entretien, par exemple, correspondent à cette forme d'amortissement; au début de la durée de vie de l'actif, les dépenses sont peu élevées, mais elles augmentent progressivement au point où les recettes produites ne les justifient pas. L'amortissement différé est représenté au moyen d'une fonction de détérioration beta (voir une explication mathématique à l'annexe).

Price Indexes

In order to be consistent with the National Income and Expenditure Accounts, the price indexes used to deflate capital stocks and flows were revised. Where before the price indexes were of a Laspeyres type, a Paasche type index is now used. The following text summarizes the changes made to these deflators.

Machinery and Equipment

Prior to the changes, the price indexes used to deflate machinery and equipment were provided by the Prices Division of Statistics Canada (Machinery and Equipment Price Indexes by Industry of Purchase, Catalogue No. 62-552). These indexes measure price movements on new fixed assets, both domestically produced and imported. Used asset price changes are not entered into the calculations so that the indexes are consistent with the capital formation measures. In many cases, purchasers are in the market too infrequently to permit the continuous collection of the prices paid for comparable assets under comparable conditions of sale. For this reason, as well as reasons of cost and response burden, extensive use is made of existing sources of producers' price information. Consequently, some elements of capitalized expense, such as freight, insurance, and installation charges may not be fully taken into account in the index calculations.

The commodity and industry weights were taken from Statistics Canada's input-output model¹. These weights were revised periodically with the latest base year for the commodity and industry weights being 1981.

To calculate the Paasche type price indexes now in use, the industry and commodity weights are taken from the input-output model for the years 1961 through to the most current year for which the weights data are available. For the period covered by the input-output model, the industry gross fixed capital formation deflators are still based on Prices Division's machinery and equipment by commodity price indexes. However, they are adjusted by the Income and Expenditure Accounts Division to measure the full purchase price of capital by including margins, taxes, etc.

Since the input-output model data begins in 1961, current period weighting could not be used for the prior years. The indexes for the years 1871 to 1960 were chained with those after 1960 using the average of the ratios of the fixed to current price indexes for the years 1961 to 1963. The reason for using three years rather than one was to ensure that all types of machinery and equipment were covered in the ratio; there may not be complete coverage of all types of machinery and equipment in any one year.

With the time frame covered by the input-output model lagging four years behind the most current year for capital formation, the price indexes for these years use the weights from the input-output model's latest year. Some annual adjustments are made to these weights to capture weight shifts reflected by the Income and Expenditure Accounts.

Indices de prix

Pour assurer la cohérence avec les comptes nationaux des revenus et des dépenses, nous avons révisé les indices de prix servant à exprimer en prix constants les flux et les stocks de capital. Les indices de Laspeyres ont fait place à des indices de Paasche. Nous résumons ci-après les modifications qui ont été apportées aux indices d'ajustement.

Machines et matériel

Avant les modifications, les indices de prix pour les machines et le matériel étaient diffusés par la Division des prix de Statistique Canada (Indices des prix des machines et du matériel selon les achats des industries, n° 62-552 au catalogue). Ces indices mesurent l'évolution des prix des immobilisations neuves, produites au pays ou importées. Comme les fluctuations des prix des actifs usagés ne sont pas incluses dans les calculs, les indices s'accordent avec les mesures de la formation du capital. Dans bien des cas, le nombre de transactions est insuffisant pour qu'on puisse relever de façon continue les prix payés pour des biens semblables dans des conditions de vente similaires. Pour cette raison et aussi pour réduire les coûts et le fardeau de réponse, on se fonde largement sur les sources existantes de prix à la production. Il se peut donc que certains éléments de dépenses capitalisées comme le fret, l'assurance et les frais d'installation, n'entrent pas entièrement dans le calcul de l'indice.

Les poids des produits et des branches d'activité viennent du modèle d'entrées-sorties de Statistique Canada¹. Ces poids sont corrigés périodiquement, et la dernière année de référence utilisée est 1981.

Afin de calculer les indices de prix du type Paasche qui sont maintenant utilisés, on se sert des poids des produits et des branches d'activité tirés du modèle d'entrées-sorties pour les années, de 1961 jusqu'à l'année actuelle, pour lesquelles on connaît ces poids. En ce qui concerne la période visée par le modèle d'entrées-sorties, les indices d'ajustement de la formation brute du capital fixe des branches d'activité reposent toujours sur les indices de prix des machines et du matériel par produit, fournis par la Division des prix. Ils sont toutefois corrigés par la Division des comptes des revenus et dépenses de manière à refléter le prix d'achat total du capital, incluant les marges, les taxes, etc.

Comme les données du modèle d'entrées-sorties commencent à 1961, on n'a pas pu utiliser les poids de la période courante. Les indices pour les années 1871 à 1960 ont été enchaînés à ceux des années suivantes par la moyenne des rapports entre l'indice des prix fixes et l'indice des prix courants pour les années 1961 à 1963. On a utilisé trois années plutôt qu'une afin que toutes les catégories de machines et de matériel soient représentées dans le rapport; une année peut en effet ne pas suffire pour englober toutes ces catégories.

Comme il y a un laps de temps de quatre ans entre la fin de la période visée par le modèle d'entrées-sorties et la dernière année pour laquelle on dispose de données sur la formation du capital, les indices de prix pour ces quatre années sont établis à l'aide des poids de la dernière année du modèle d'entrées-sorties. Des corrections sont apportées annuellement à ces poids pour tenir compte des

¹ This model is explained in Statistics Canada "The Input-output Structure of the Canadian Economy", Catalogue No. 15-201.

¹ Ce modèle est expliqué dans la publication intitulée "La structure par entrées-sorties de l'économie canadienne", n° 15-201 au catalogue.

These estimated weights are replaced with weights from the input-output model as data for additional years becomes available.

Building Construction

Prices Division provides price indexes based on the selling prices of buildings but this data only goes back to 1971. Prior to 1971, the structure type deflators are weighted averages of the price indexes for construction inputs such as labour, concrete, steel, architectural services, and contractor's profits. The weights are calculated from the average quantities of each input used in the various types of structures.

In the old system, the industry indexes were weighted averages of the above-mentioned structure type price indexes using fixed weights. The weights were derived from the 1981-1984 average capital expenditures on the different types of buildings by industry².

Now, current period weights are applied to the structure type price indexes but only for the years 1981 to the present. As before, the weights are calculated using the data published in "Construction in Canada". For all earlier years, the fixed weighted price indexes are used.

Engineering Construction

The current engineering construction price indexes by industry are calculated in the same way as those for building construction, i.e. fixed weights by structure for the years 1871 to 1980 and current weights after that. Prior to the new price system, the engineering construction price indexes used fixed weights over the entire time span and these weights were calculated in the same manner as the building construction weights. The commodity price indexes up to 1971 are weighted averages of the construction input price indexes calculated in the same way as those for the building construction price indexes. In 1971, price indexes based on selling prices were introduced for some types of engineering construction, highways being the major example, otherwise they continue to be calculated using input prices. Information on the output based price indexes can be found in the Statistics Canada publication *Construction Price Statistics*, Catalogue No. 62-007. The input based price indexes are calculated by the Income and Expenditure Accounts Division.

variations de poids dans les comptes des revenus et dépenses. Les poids estimés sont remplacés par des poids du modèle d'entrées-sorties au fur et à mesure que de nouvelles données annuelles s'ajoutent.

Construction de bâtiments

La Division des prix produit des indices de prix fondés sur le prix de vente des bâtiments, mais ces données ne remontent qu'à 1971. Pour les années antérieures, les indices d'ajustement par type de bâtiment correspondent à des moyennes pondérées des indices de prix pour les entrées de la construction tels la main-d'œuvre, le béton, l'acier, les services d'architecte et les bénéfices des entrepreneurs. Les poids sont calculés à partir des quantités moyennes de chaque entrée utilisées dans les divers types de bâtiments.

Dans l'ancien système, les indices par branche d'activité étaient des moyennes pondérées des indices dont nous venons de parler, par type de bâtiment, où les poids étaient fixes. Ceux-ci étaient établis à partir des dépenses d'investissement moyennes par branche d'activité pour la période 1981 à 1984, selon les divers types de bâtiments².

On applique maintenant les poids de la période courante aux indices par type de bâtiment, mais seulement à compter de 1981. Les poids sont toujours calculés à l'aide des données publiées dans *La construction au Canada*. En ce qui concerne les années antérieures, on utilise les indices pondérés fixes.

Travaux de génie

Les indices de prix actuellement publiés pour les travaux de génie par branche d'activité sont calculés de la même manière que les indices pour la construction de bâtiments, c'est-à-dire poids fixes par type de bâtiment pour les années 1871 à 1980 et poids courants pour les années subséquentes. Dans l'ancien système, les indices pour les travaux de génie reposaient sur des poids fixes pour toutes les années, et ces poids étaient calculés de la même manière que les poids pour la construction de bâtiments. Pour les années antérieures à 1971, les indices de prix des produits sont des moyennes pondérées d'indices de prix des entrées de la construction, calculées de la même manière que les moyennes pondérées d'indices pour la construction de bâtiments. En 1971, on a produit pour la première fois des indices de prix fondés sur des prix de vente pour certains travaux de génie, notamment la construction de routes; dans les autres cas, les indices sont toujours calculés à l'aide des prix des entrées. On peut trouver dans la publication de Statistique Canada intitulée *Statistiques des prix de la construction*, n° 62-007 au catalogue, des renseignements sur les indices de prix fondés sur les sorties. Les indices de prix fondés sur les entrées sont calculés par la Division des comptes des revenus et dépenses.

² This capital expenditures information can be found in the Statistics Canada publication "Construction in Canada", Catalogue No. 64-201.

² La publication *La construction au Canada*, n° 64-201 au catalogue, renferme des données de ce genre.

Reconciliation of Investments in Fixed Capital

Data on investments in fixed capital are published in "National Income and Expenditure Accounts" (Catalogue No. 13-201), "Private and Public Investment in Canada" (Catalogue No. 61-205) and "Fixed Capital Flows and Stocks" (Catalogue No. 13-568). If users of the data compare the three sources, they will find differences in some years. The following table, using 1992 as an example, reconciles the data and explains the differences.

Rapprochement des Investissements en capital fixe

Des données d'investissements en capital fixe sont publiées dans le n° 13-201 au catalogue «Comptes nationaux des revenus et des dépenses», dans le n° 61-205 au catalogue «Investissements privés et publics au Canada», de même que dans le n° 13-568 au catalogue «Flux et stocks de capital fixe». Les usagers des données d'investissements pourront observer des différences pour certaines années en comparant les trois sources. En se servant de l'année 1992 comme exemple, nous avons préparé le tableau de rapprochement qui suit et expliqué les différences.

Footnotes to Reconciliation Table

¹ Includes statistical revisions which have not been incorporated in "Private and Public Investment in Canada" (Catalogue No. 61-205). These revisions could be due to the incorporation of more up-to-date estimates such as those for residential investments, as in this case. They might also be due to adjustments arising from integration with other series such as imports of new aircraft by utilities, or, in earlier years, coverage of investment in machinery and equipment by leasing companies.

² Adjustments are made to bring the investment data into line with national accounting concepts. In publication Catalogue Nos. 61-205 and 13-568, investment series are classified according to their principal activities, whereas in the publication Catalogue No. 13-201 (National Income and Expenditure Accounts), municipal water systems and some government entities are included in the government sector.

For construction, these adjustments also include additions for transfer costs for the sale and purchase of residential buildings and land by the housing sector, and non-residential buildings and land by the trade, finance and commercial services sector. A deduction for National Defence construction is also made, since it is not considered as investment in the national accounts.

For machinery and equipment, these adjustments also include deductions for scrap and salvage, used vehicle sales to consumers by the government and business sectors, some tooling expenditures in the automobile industry, exports of used assets and purchases of national defence machinery and equipment by the government sector.

In addition to these adjustments, the national accounts occasionally incorporate coverage adjustments.

Notes pour le tableau de rapprochement

¹ Comprend des révisions d'ordre statistique n'ayant pas encore été incorporées dans «Investissements privés et publics au Canada, Perspective» (n° 61-205 au catalogue). Ces révisions peuvent être dues au fait qu'on tient compte d'estimations plus à jour, comme celles des investissements résidentiels dans ce cas-ci. De même, elles peuvent être dues à des ajustements résultant de l'intégration avec d'autres séries comme celles des importations d'aréonefs par le groupe des services d'utilité publique ou, comme on a déjà vu, la couverture des investissements des compagnies de location de machines et d'équipement.

² Des ajustements sont apportés afin d'exprimer les données selon les concepts de la comptabilité nationale. Dans les publications n°s 61-205 et 13-568 au catalogue, les dépenses en immobilisations sont classifiées d'après leurs activités principales, tandis que dans la publication n° 13-201 au catalogue (Comptes nationaux des revenus et des dépenses), certaines entreprises publiques et les systèmes municipaux d'eau sont comptés comme faisant partie des services gouvernementaux.

Pour ce qui est de la construction, ces ajustements comprennent également des ajouts pour tenir compte des coûts de transfert pour la vente et l'achat d'immeubles résidentiels et de terrains par le secteur du logement, et d'immeubles non résidentiels et de terrains par le secteur du commerce, des finances et des services commerciaux. Une déduction pour la construction de la Défense nationale est également faite, car cette construction n'est pas considérée comme un investissement dans les comptes nationaux.

Pour ce qui est des machines et de l'outillage, ces ajustements comprennent également des déductions pour les rebuts et le matériel récupéré, les ventes de véhicules usagés aux consommateurs par le secteur public et le secteur des affaires, certaines dépenses d'outillage de l'industrie automobile, les exportations de biens usagés et les achats de machinerie et de matériel pour la Défense nationale par le secteur public.

Outre ces rajustements, les comptes nationaux intègrent à l'occasion des rajustements de couverture.

Explanatory Note:**Impact of Price Index Rebasing on Historical Constant Dollar Investment Series****Introduction**

The historical constant dollar investment series produced by the Investment and Capital Stock Division (ICSD) and those produced by the System of National Accounts (SNA) can differ significantly at aggregate component levels, even when allowances are made for conceptual differences and special adjustments. This has been a source of confusion to many users and given rise to numerous enquiries. The differences arise from the impact of changes in the base years of the price indexes used to compute investment data in constant dollars, and a difference between the two sources in the process of incorporating these changes.

The ingredients used by the two sources are essentially the same: expenditures in current dollars on the two components (machinery and equipment, and construction), and price indexes. In ICSD, the breakdown of expenditures on each component is by the industry of use, whereas in SNA, the breakdown is by commodity for all industries. When the two sources aggregate their data in current dollars to component level for all industries, they arrive at the same totals. How, then, do the differences arise in the constant dollar series?

Let us assume that we are beginning our compilation of constant dollar data during the 1960's and are therefore using the 1961-based price indexes. This means that from 1961 to 1971, the constant dollar aggregations to the component level for all industries will be same from both sources. However, 1971 is the last year for which price indexes on the 1961 base are produced. A new base is introduced, and the on-going price indexes will have the value for 1971 equal to 100. The constant dollar expenditure data for 1961 to 1970 must therefore be rebased to be consistent with these new indexes.

SNA Method – 1971 Rebasing

In the SNA, the expenditures for 1971 are deflated at the commodity level using the 1961-based indexes for 1971. The constant dollar data is then aggregated to component level, as is the current dollar data (which is, of course, the constant dollar data according to the new base of 1971 = 100). A rebasing factor is calculated by dividing the current dollar component total for 1971, by the constant dollar total for 1971 according to the 1961-based price indexes. This factor is then multiplied by the constant dollar all industry component total of each year from 1961 to 1970 to arrive at estimates of 1971-based constant dollar totals for these years.

ICSD Method – 1971 Rebasing

In ICSD, the price indexes themselves are rebased to 1971 = 100 for the period 1961 to 1970. This process consists of dividing each year's value of an index on the 1961 base by the value of the index for 1971, also on the 1961

Note explicative :**Effet du rajeunissement des Indices de prix sur les séries de dépenses en immobilisations en dollars constants****Introduction**

Les séries de dépenses en immobilisations en dollars constants produites par la Division de l'investissement et du stock de capital (DISC) peuvent différer sensiblement de celles produites par le Système de comptabilité nationale (SCN) au niveau des composantes, même lorsqu'on tient compte des différences de définition et des ajustements spéciaux. Cette divergence crée de la confusion dans l'esprit de beaucoup d'utilisateurs et suscite de nombreuses interrogations. On attribue cette divergence à l'effet du rajeunissement des indices de prix qui servent à exprimer les dépenses en immobilisations en dollars constants et à une différence de méthodes entre les deux sources.

Les deux sources utilisent essentiellement les mêmes données : dépenses en dollars courants pour les deux composantes (machines et matériel, et construction) et indices de prix. Dans la DISC, les dépenses pour chaque composante sont ventilées selon l'industrie d'utilisation alors que dans le SCN, elles sont ventilées selon le produit pour l'ensemble des industries. Lorsque les données en dollars courants sont agrégées par composante dans l'une et l'autre source, les totaux sont identiques. Alors, comment se fait-il qu'il y a des différences dans les séries en dollars constants?

Supposons que nous commençons à rassembler des données en dollars constants pour les années 1960 et que nous utilisons par conséquent des indices de prix ayant pour base 1961. Cela signifie que pour la période de 1961 à 1971, les totaux en dollars constants par composante pour l'ensemble des industries seront les mêmes pour les deux sources. Or, 1971 est la dernière année pour laquelle sont produits des indices de prix à base 1961. Une nouvelle base est créée et la valeur des indices de prix courants pour 1971 sera égale à 100. Il faut donc rajuster les dépenses en immobilisations en dollars constants pour la période de 1961 à 1970 pour que ces données soient conformes aux nouveaux indices.

Changement de base pour 1971 – selon le SCN

Dans le SCN, on corrige les dépenses de 1971 par produit au moyen des indices à base 1961 pour 1971. On fait ensuite la somme des données en dollars constants par composante, comme on le fait pour les données en dollars courants (les données en dollars constants sont établies évidemment selon la nouvelle base 1971 = 100). On calcule un facteur de rajeunissement de l'indice en divisant le total de la composante en dollars courants pour 1971 par le total en dollars constants pour la même année (calculé au moyen des indices à base 1961). On multiplie ensuite ce facteur par le total de la composante (toutes industries) en dollars constants pour chaque année de la période 1961-1970 pour obtenir le total estimé en dollars constants (1971 = 100) pour cette période.

Changement de base pour 1971 – selon la DISC

Selon la méthode de la DISC, les indices proprement dits sont recalculés sur la base 1971 = 100 pour la période de 1961 à 1970. L'opération consiste à diviser la valeur de l'indice calculé sur la base 1961 pour chaque année par la valeur du même indice pour

base. The constant dollar series by industry are then re-calculated using the rebased indexes to deflate the current dollar series. Because this deflation process involves dividing each year's current dollar value by a price index which is itself a ratio, the rebased constant dollar value for each year is equal to the product of the old constant dollar value multiplied by the 1971 value of the old 1961-based price index.

The rebased component total for all industries for each year in the rebasing period is derived by summing the rebased industry level constant dollar series, and is therefore a sum of products for each year. In fact, this can be regarded as a weighted sum by year of the value of each industry's price index for 1971 according to the 1961 base, with the weights being the value of each industry's constant dollar expenditures according to the 1961 base.

Comparison – 1971 Rebasing

In order to compare the impact of the ICSD rebasing method with that of the SNA, let us divide ICSD's 1971-based constant dollar component total series by its corresponding 1961-based series for each year in the adjustment period (the sum of the weights mentioned above). The result is a weighted average, for each year in the rebasing period, of the industry-level price indexes for the year 1971 according to the 1961 base. Thus, as with the SNA method, we can multiply the 1961-based constant dollar component total for all industries by a factor to obtain a 1971-based constant dollar value. The difference is that under the ICSD method, there is a different factor for each year in the adjustment period, whereas under the SNA method, the factor is the same for all years. In fact, as shown below in the mathematical version of this explanation, the SNA factor is the particular value of the weighted average when the year is 1971. Rebasing by a constant factor at the all industry level by component allows the SNA to maintain the previously established growth rates at that level of aggregation over the period of adjustment. The ICSD method, on the other hand, maintains historical growth rates at the industry level by component, but not at the all industry level by component.

Thus we can see that after only one change of base in the price indexes, the constant dollar series produced by the two sources differ at the all industry level by component for the years in the adjustment period. What happens when further changes of base are introduced, as for example, in 1981?

Multiple Rebasing

SNA Method – 1981 Rebasing

As before, the SNA deflates the commodity level expenditures for 1981 using the 1971-based indexes to derive 1971-based constant dollar expenditures by commodity for 1981, accumulates over commodities and then divides this

1971, calculé aussi sur la base 1961. On recalcule ensuite les séries en dollars constants par industrie au moyen des indices à nouvelle base. Comme cette opération consiste dans la division d'une valeur en dollars courants par un indice de prix qui est lui-même un ratio, la valeur en dollars constants calculée sur la nouvelle base pour chaque année est égale au produit de l'ancienne valeur en dollars constants par la valeur pour 1971 de l'ancien indice de prix à base 1961.

On calcule le nouveau total de composante (toutes industries) pour chaque année de la période de rajeunissement en faisant la somme des séries en dollars constants de chaque industrie calculées sur la nouvelle base; il s'agit donc d'une somme de produits pour chaque année. De fait, on peut considérer ce nouveau total comme la somme pondérée, pour chaque année, des indices de prix de chaque industrie pour 1971 calculés sur la base 1961, les poids étant en l'occurrence les dépenses en dollars constants de chaque industrie calculées sur la base 1961.

Changement de base pour 1971 – Comparaison

Afin de comparer l'incidence de la méthode de rajeunissement de l'indice utilisée par la DISC avec celle de la méthode appliquée dans le SCN, divisons la série de totaux de composantes en dollars constants (1971 = 100) de la DISC par la série de totaux de composantes calculée sur la base 1961 = 100 pour chaque année de la période de rajeunissement (c.-à-d. la somme des poids mentionnée plus haut). On obtient ainsi, pour chaque année de la période de rajeunissement, une moyenne pondérée des indices de prix des industries pour 1971 calculés sur la base 1961. Donc, comme pour la méthode utilisée dans le SCN, nous pouvons multiplier le total de composante (toutes industries) en dollars constants (1961 = 100) par un facteur pour obtenir une valeur en dollars constants calculée sur la base 1971. La différence entre la méthode de la DISC et celle utilisée dans le SCN est que dans le premier cas, il existe un facteur différent pour chaque année de la période de rajeunissement alors que dans le second cas, c'est le même facteur pour toutes les années. En fait, comme on peut le voir dans l'annexe mathématique qui accompagne ce texte, le facteur pour le SCN équivaut à la moyenne pondérée lorsqu'il s'agit de l'année 1971. Si, pour chaque composante, on se sert d'un facteur de rajeunissement constant au niveau global, on conserve les taux de croissance antérieurs observés à ce niveau d'agrégation pour toute la période de rajeunissement. Par ailleurs, la méthode de la DISC permet de conserver les taux de croissance antérieurs pour chaque industrie prise individuellement mais non pour l'ensemble des industries.

Nous pouvons donc constater qu'après un seul changement de base d'indice, les séries en dollars constants produites par les deux sources diffèrent entre elles pour chaque composante pour les années de la période de rajeunissement de l'indice. Qu'arrive-t-il lorsqu'on effectue d'autres changements de base, comme cela fut le cas en 1981?

Changements de base multiples

Changement de base pour 1981 – selon le SCN

Comme précédemment, la méthode du SCN consiste à corriger les dépenses par produit pour 1981 au moyen des indices à base 1971 (ce qui donne les dépenses par produit en dollars constants (1971 = 100) pour 1981), à faire la somme de ces dépenses, puis

total into the corresponding total of current dollar expenditures for 1981, to produce a new rebasing factor. This factor is multiplied by the 1971-based constant dollar all industry component totals for 1961 to 1980 to derive 1981-based constant dollar data for the period.

ICSD Method – 1981 Rebasing

In ICSD, the process of rebasing the prices is carried out as before, by dividing each year's value of the 1971-based index by the 1981 value of the index on the 1971 base. However, the indexes for the years 1961 to 1970 were already rebased from the 1961 base to the 1971 base. Hence each year's value of an index for this period is equal to the old 1961-based price index divided by the product of the value of the 1961-based index for 1971 and the value of the 1971-based index for 1981. After deflating the current dollar expenditures by industry for 1961 to 1980, the rebased constant dollar values for 1971 to 1980 are equal to the 1971-based constant dollar values multiplied by the 1981 value of the price index on the 1971 base, but the 1981-based values for 1961 to 1970 are equal to the 1961-based constant dollar values multiplied by the product of the 1961-based index for 1971 and the 1971-based index for 1981. As before, the 1981-based component total for all industries for each year is derived by summing the rebased industry level expenditures, and again, this can be regarded as a weighted sum, this time using the value of each industry's 1971-based constant dollar expenditures to weight each industry's price index for 1981 according to the 1971 base.

Comparison – 1981 Rebasing

When we again compare the impact of the difference between the two methods, we find that the ICSD adjustment factor is a weighted average, for each year in the rebasing period, of the industry level price indexes for the year 1981 according to the 1971 base, with the weights being the value of the 1971-based constant dollar expenditures. As before, we also find that the SNA adjustment factor for the period is the particular value of the weighted average when the year is 1981. However, the 1971-based data for 1961 to 1970 were already rebased. This means that the 1981-based constant dollar series for 1961 to 1970 is the 1961-based constant dollar series multiplied by the product of two weighted averages. In the case of ICSD, the value of each of these averages varies with the year, whereas in the SNA, the value of each average is fixed over the period. Thus the differences between the constant dollar data for 1961 to 1970 from the two sources have become compounded after a second rebasing. Subsequent rebasing will follow the same pattern; for example, as a result of the introduction of 1986 as a base year, the period from 1961 to 1970 will involve three weighted averages, the period from 1971 to 1980 two, and the period from 1981 to 1985 one.

à diviser le total des dépenses en dollars courants pour 1981 par le total des dépenses en dollars constants; on obtient ainsi un nouveau facteur de rajeunissement. Celui-ci est multiplié par chacun des totaux de composante (toutes industries) en dollars constants (1971 = 100) pour les années 1961 à 1980 pour obtenir les données en dollars constants (1981 = 100) pour la période.

Changement de base pour 1981 – selon la DISC

À la DISC, le changement de base s'effectue comme avant, c'est-à-dire en divisant la valeur de l'indice calculé sur la base 1971 pour chaque année par la valeur du même indice pour 1981, calculé sur la base 1971. Or, la base des indices pour les années 1961 à 1970 a déjà été changée une fois; elle est passée de 1961 à 1971. Par conséquent, la valeur d'un indice pour chaque année de cette période est égale au quotient de l'ancien indice de prix ayant pour base 1961 par le produit de la valeur de l'indice à base 1961 pour 1971 par la valeur du même indice à base 1971 pour 1981. Une fois déflatées les dépenses en dollars courants par industrie pour la période 1961-1980, les valeurs en dollars constants pour la période 1971-1980 recalculées sur une nouvelle base sont égales au produit des valeurs en dollars constants calculées sur la base 1971 par la valeur de l'indice de prix pour 1981 calculée sur la base 1971; cependant, les valeurs calculées sur la base 1981 pour chaque année de la période 1961-1970 sont égales au produit des valeurs en dollars constants calculées sur la base 1961 par le produit de l'indice à base 1961 pour 1971 par l'indice à base 1971 pour 1981. Comme avant, on calcule le total de composante (toutes industries) pour chaque année (1981 = 100) en faisant la somme des dépenses par industrie recalculées sur une nouvelle base; là encore, cette somme peut être considérée comme une somme pondérée, la valeur des dépenses en dollars constants (1971 = 100) de chaque industrie servant de poids pour l'indice des prix de l'industrie pour 1981 sur la base 1971.

Changement de base pour 1981 – Comparaison

Lorsqu'on compare une fois de plus les effets des deux méthodes de rajeunissement de l'indice, on constate que le facteur de correction de la méthode de la DISC est une moyenne pondérée, pour chaque année de la période de rajeunissement, des indices des prix des industries pour 1981 sur la base 1971, les poids étant la valeur des dépenses en dollars constants (1971 = 100). Comme précédemment, on constate aussi que le facteur de correction de la méthode du SCN pour la période correspond à la valeur de la moyenne pondérée lorsqu'il s'agit de l'année 1981. Or, les données pour la période de 1961 à 1970 calculées sur la base 1971 ont déjà été recalculées sur une nouvelle base. Cela signifie que la série en dollars constants (1981 = 100) pour la période de 1961 à 1970 équivaut au produit de la série en dollars constants (1961 = 100) par le produit de deux moyennes pondérées. Dans le cas de la DISC, la valeur de chacune de ces moyennes varie selon l'année alors que dans le cas du SCN, la valeur de chaque moyenne est fixe pour la durée de la période. Par conséquent, les différences entre les données en dollars constants tirées de l'une et l'autre sources pour la période 1961-1970 se sont amplifiées après un second changement de base. On observera la même chose dans les changements de base futurs; par exemple, avec l'introduction d'une nouvelle année de base (1986), il y aura trois moyennes pondérées pour la période 1961-1970, deux pour la période 1971-1980 et une pour la période 1981-1985.

Summary

The differences between the historical constant dollar series produced by the SNA and ICSD arise as a result of the different rebasing techniques used by the two areas. These differences will tend to become more exaggerated the further away the data is from the current base period, since it will have been subjected to more rebasing. The rebasing factors used by both areas are weighted averages of the value of the individual indexes for the year of the introduction of the new base but evaluated according to the previous base year, and using as weights the constant dollar data to be rebased. In ICSD, the value of the adjustment varies with each year in the adjustment period, whereas the SNA factors are the weighted averages when the year is the new base year, and are constant over the period of adjustment. The SNA method maintains the previously established growth rates at the all industry component total level of aggregation over the period of adjustment. The ICSD method, on the other hand, maintains historical growth rates at the industry level by component, but not at the all industry level by component.

Mathematical Illustration

ICSD Method – 1971 Rebasing

Under 1961-based prices, the constant dollar investment series for 1961 to 1970 is

$$K_{j,t}^{B61} = C_{j,t} / P_{j,t}^{B61} \quad (1)$$

where

t = year

j = expenditure sub-component

C = current dollar expenditure

P = price index

K = constant dollar expenditure

and B61 indicates that 1961 is the base year of the price indexes.

The 1971-based indexes are linked to the 1961-based indexes as follows:

$$P_{j,t}^{B71} = P_{j,t}^{B61} / P_{j,71}^{B61} \quad (2)$$

for 1961 to 1970. Therefore, the rebased constant dollar investment series for 1961 to 1970 are

$$\begin{aligned} K_{j,t}^{B71} &= C_{j,t} / (P_{j,t}^{B61} / P_{j,71}^{B61}) \\ &= K_{j,t}^{B61} \cdot P_{j,71}^{B61} \end{aligned} \quad (3)$$

The constant dollar, all industry component total, rebased to 1971 dollars, for 1961 to 1970 is

$$K_t^{B71} = \sum_j (K_{j,t}^{B61} \cdot P_{j,71}^{B61}) \quad (4)$$

Résumé

Les différences entre les séries chronologiques en dollars constants produites par le SCN d'une part et la DISC d'autre part s'expliquent par le fait que les deux secteurs n'utilisent pas la même méthode de rajeunissement de l'indice des prix. Ces différences tendront à s'amplifier à mesure qu'on s'éloignera de l'année de base courante, puisqu'il se sera fait d'autres changements de base. Les facteurs de rajeunissement qu'utilisent les deux secteurs sont des moyennes pondérées des différents indices se rapportant à l'année d'introduction d'une nouvelle base mais ils sont calculés en fonction de l'année de base précédente et utilisent comme poids les données en dollars constants qui doivent être recalculées sur une nouvelle base. En ce qui concerne la méthode de la DISC, le facteur de correction varie selon l'année de la période de rajeunissement, alors que dans le cas du SCN, les facteurs de correction sont des moyennes pondérées lorsqu'il s'agit d'une nouvelle année de référence, et sont constants pour la durée de la période de rajeunissement. La méthode du SCN conserve les taux de croissance observés antérieurement au niveau global pour toute la période de rajeunissement. Par contre, la méthode de la DISC conserve les taux de croissance historiques au niveau de l'industrie pour chaque composante mais non au niveau global.

Formules mathématiques

Changement de base pour 1971 – selon la DISC

En prix de 1961, la série de dépenses en immobilisations en dollars constants pour la période de 1961 à 1970 est

$$K_{j,t}^{B61} = C_{j,t} / P_{j,t}^{B61} \quad (1)$$

où

t = année

j = poste de dépense

C = dépenses en dollars courants

P = indice de prix

K = dépenses en dollars constants

et où B61 indique que 1961 est l'année de base des indices de prix.

Les indices à base 1971 sont rattachés aux indices ayant pour base 1961 selon la formule suivante :

$$P_{j,t}^{B71} = P_{j,t}^{B61} / P_{j,71}^{B61} \quad (2)$$

pour la période de 1961 à 1970. Par conséquent, la série de dépenses en immobilisations en dollars constants calculée sur une nouvelle base pour la période 1961-1970 s'écrit

$$\begin{aligned} K_{j,t}^{B71} &= C_{j,t} / (P_{j,t}^{B61} / P_{j,71}^{B61}) \\ &= K_{j,t}^{B61} \cdot P_{j,71}^{B61} \end{aligned} \quad (3)$$

Le total de composante pour l'ensemble des industries en dollars constants, recalculé sur la base 1971, pour la période de 1961 à 1970, est

$$K_t^{B71} = \sum_j (K_{j,t}^{B61} \cdot P_{j,71}^{B61}) \quad (4)$$

The constant dollar, all industry component total for 1961 to 1970 based on 1961 dollars is

$$K_t^{B61} = \sum_j K_{j,t}^{B61} \quad (5)$$

The ratio of K_t^{B71} to K_t^{B61} is

$$\begin{aligned} K_t^{B71}/K_t^{B61} &= \frac{\sum_j (K_{j,t}^{B61} \cdot P_{j,71}^{B61})}{\sum_j K_{j,t}^{B61}} \\ &= [\overline{P}_{71}]_t^{B61} \end{aligned} \quad (6)$$

$[\overline{P}_{71}]_t^{B61}$ is a series of weighted averages of the 1961-based industry level indexes for the year 1971, using the 1961-based constant dollar sub-component investment for each year in the adjustment period as weights. Thus for 1961 to 1970

$$K_t^{B71} = [\overline{P}_{71}]_t^{B61} \cdot K_t^{B61} \quad (7)$$

ICSD Method - 1981 Rebasing

When the price indexes are rebased to 1981 = 100, the 1971-based price indexes are linked to the 1981 price indexes as follows for the period 1961 to 1980:

$$P_{j,t}^{B81} = P_{j,t}^{B71}/P_{j,81}^{B71} \quad (8)$$

The rebased constant dollar expenditures for 1961 to 1980 are:

$$\begin{aligned} K_{j,t}^{B81} &= C_{j,t} / (P_{j,t}^{B71}/P_{j,81}^{B71}) \\ &= K_{j,t}^{B71} \cdot P_{j,81}^{B71} \end{aligned} \quad (9)$$

The constant dollar, all industry component total, rebased to 1981 dollars for 1961 to 1980 is

$$K_t^{B81} = \sum_j (K_{j,t}^{B71} \cdot P_{j,81}^{B71}) \quad (10)$$

The ratio of K_t^{B81} to K_t^{B71} is

$$\begin{aligned} K_t^{B81}/K_t^{B71} &= \frac{\sum_j (K_{j,t}^{B71} \cdot P_{j,81}^{B71})}{\sum_j K_{j,t}^{B71}} \\ &= [\overline{P}_{81}]_t^{B71} \end{aligned} \quad (11)$$

Le total de composante pour l'ensemble des industries en dollars constants (1961 = 100) pour la même période est

$$K_t^{B61} = \sum_j K_{j,t}^{B61} \quad (5)$$

Le rapport de K_t^{B71} à K_t^{B61} est

$$\begin{aligned} K_t^{B71}/K_t^{B61} &= \frac{\sum_j (K_{j,t}^{B61} \cdot P_{j,71}^{B61})}{\sum_j K_{j,t}^{B61}} \\ &= [\overline{P}_{71}]_t^{B61} \end{aligned} \quad (6)$$

$[\overline{P}_{71}]_t^{B61}$ est une série de moyennes pondérées des indices des industries pour 1971 sur la base 1961, les poids étant les dépenses en immobilisations en dollars constants (1961 = 100) des sous-composantes pour chaque année de la période de rajeunissement. Donc, pour la période 1961-1970,

$$K_t^{B71} = [\overline{P}_{71}]_t^{B61} \cdot K_t^{B61} \quad (7)$$

Changement de base pour 1981 - selon la DISC

Lorsqu'on change la base des indices de prix pour 1981, les indices à base 1971 sont raccordés aux indices ayant pour base 1981 selon la formule suivante (pour la période 1961-1980) :

$$P_{j,t}^{B81} = P_{j,t}^{B71}/P_{j,81}^{B71} \quad (8)$$

La série de dépenses en dollars constants calculée sur la nouvelle base pour la période 1961-1980 s'écrit

$$\begin{aligned} K_{j,t}^{B81} &= C_{j,t} / (P_{j,t}^{B71}/P_{j,81}^{B71}) \\ &= K_{j,t}^{B71} \cdot P_{j,81}^{B71} \end{aligned} \quad (9)$$

Le total de composante pour l'ensemble des industries en dollars constants, recalculé sur la base 1981, pour la période de 1961 à 1980, est

$$K_t^{B81} = \sum_j (K_{j,t}^{B71} \cdot P_{j,81}^{B71}) \quad (10)$$

Le rapport de K_t^{B81} à K_t^{B71} est

$$\begin{aligned} K_t^{B81}/K_t^{B71} &= \frac{\sum_j (K_{j,t}^{B71} \cdot P_{j,81}^{B71})}{\sum_j K_{j,t}^{B71}} \\ &= [\overline{P}_{81}]_t^{B71} \end{aligned} \quad (11)$$

Hence

$$K_t^{B81} = [\overline{P}_{81}]_t^{B71} \cdot K_t^{B71}. \quad (12)$$

But for 1961 to 1970,

$$K_t^{B71} = [\overline{P}_{71}]_t^{B61} \cdot K_t^{B61} \quad (13)$$

and therefore

$$K_t^{B81} = [\overline{P}_{71}]_t^{B61} \cdot [\overline{P}_{81}]_t^{B71} \cdot K_t^{B61}. \quad (14)$$

SNA Method – 1971 Rebasings

In the National Accounts system, the commodity data for 1971 are deflated using the 1961-based price indexes for 1971, and accumulated to the component level:

$$\begin{aligned} K_{j,71}^{B61} &= C_{j,71} / P_{j,71}^{B61} \\ K_{71}^{B61} &= \sum_j K_{j,71}^{B61} \end{aligned} \quad (15)$$

The component level 1971-based investment for 1971 is

$$\begin{aligned} K_{71}^{B71} &= \sum_j C_{j,71} \\ &= \sum_j (C_{j,71} / P_{j,71}^{B61}) \cdot P_{j,71}^{B61} \\ &= \sum_j (K_{j,71}^{B61} \cdot P_{j,71}^{B61}). \end{aligned} \quad (16)$$

The ratio K_{71}^{B71} to K_{71}^{B61} is

$$\begin{aligned} K_{71}^{B71} / K_{71}^{B61} &= \frac{\sum_j (K_{j,71}^{B61} \cdot P_{j,71}^{B61})}{\sum_j K_{j,71}^{B61}} \\ &= [\overline{P}_{71}]_{71}^{B61}. \end{aligned} \quad (17)$$

$[\overline{P}_{71}]_{71}^{B61}$ (the value of equation (1) when $t = 1971$) is used to convert the constant dollar total component series from the 1961-based prices to the 1971-based, for 1961 to 1970.

$$K_t^{B71} = [\overline{P}_{71}]_{71}^{B61} \cdot K_t^{B61}. \quad (18)$$

D'où

$$K_t^{B81} = [\overline{P}_{81}]_t^{B71} \cdot K_t^{B71}. \quad (12)$$

Or, pour la période 1961-1970,

$$K_t^{B71} = [\overline{P}_{71}]_t^{B61} \cdot K_t^{B61} \quad (13)$$

et donc,

$$K_t^{B81} = [\overline{P}_{71}]_t^{B61} \cdot [\overline{P}_{81}]_t^{B71} \cdot K_t^{B61}. \quad (14)$$

Changement de base pour 1971 – selon le SCN

Dans le Système de comptabilité nationale, on corrige les données sur les produits pour 1971 au moyen des indices de prix de 1971 ayant pour base 1961, puis on fait la somme de ces données pour chaque composante :

$$\begin{aligned} K_{j,71}^{B61} &= C_{j,71} / P_{j,71}^{B61} \\ K_{71}^{B61} &= \sum_j K_{j,71}^{B61} \end{aligned} \quad (15)$$

Les dépenses en immobilisations par composante pour 1971, calculées sur la base 1971, sont définies par l'équation

$$\begin{aligned} K_{71}^{B71} &= \sum_j C_{j,71} \\ &= \sum_j (C_{j,71} / P_{j,71}^{B61}) \cdot P_{j,71}^{B61} \\ &= \sum_j (K_{j,71}^{B61} \cdot P_{j,71}^{B61}). \end{aligned} \quad (16)$$

Le rapport de K_{71}^{B71} à K_{71}^{B61} est

$$\begin{aligned} K_{71}^{B71} / K_{71}^{B61} &= \frac{\sum_j (K_{j,71}^{B61} \cdot P_{j,71}^{B61})}{\sum_j K_{j,71}^{B61}} \\ &= [\overline{P}_{71}]_{71}^{B61}. \end{aligned} \quad (17)$$

$[\overline{P}_{71}]_{71}^{B61}$ (la valeur de l'équation (1) lorsque $t = 1971$) sert à réexprimer la série de dépenses en immobilisations d'une composante pour l'ensemble des industries en fonction de la nouvelle année de base (1971) pour la période 1961-1970 :

$$K_t^{B71} = [\overline{P}_{71}]_{71}^{B61} \cdot K_t^{B61}. \quad (18)$$

SNA Method – 1981 Rebasings

When the 1981-based price indexes are introduced, the commodity for 1981 are deflated using the 1971-based price indexes for 1981 and accumulated as before:

$$\begin{aligned} K_{j,81}^{B71} &= C_{j,81} / P_{j,81}^{B71} \\ K_{81}^{B71} &= \sum_j K_{j,81}^{B71} \end{aligned} \quad (19)$$

The component level 1981-based investment data for 1981 is

$$\begin{aligned} K_{81}^{B81} &= \sum_j C_{j,81} \\ &= \sum_j (C_{j,81} / P_{j,81}^{B71}) \cdot P_{j,81}^{B71} \\ &= \sum_j (K_{j,81}^{B71} \cdot P_{j,81}^{B71}). \end{aligned} \quad (20)$$

The ratio of K_{81}^{B81} to K_{81}^{B71} is

$$\begin{aligned} K_{81}^{B81} / K_{81}^{B71} &= \frac{\sum_j (K_{j,81}^{B71} \cdot P_{j,81}^{B71})}{\sum_j K_{j,81}^{B71}} \\ &= [\overline{P}_{81}]_{81}^{B71}. \end{aligned} \quad (21)$$

Thus

$$K_t^{B81} = [\overline{P}_{81}]_{81}^{B71} \cdot K_t^{B71}. \quad (22)$$

But for 1961 to 1970,

$$K_t^{B71} = [\overline{P}_{71}]_{71}^{B61} \cdot K_t^{B61} \quad (23)$$

and hence

$$K_t^{B81} = [\overline{P}_{71}]_{71}^{B61} \cdot [\overline{P}_{81}]_{81}^{B71} \cdot K_t^{B61}. \quad (24)$$

Changement de base pour 1981 – selon le SCN

Lorsqu'on change la base des indices de prix pour 1981, on corrige les données sur les produits pour 1981 au moyen des indices de prix de 1981 ayant pour base 1971, puis on fait la somme de ces données pour chaque composante :

$$\begin{aligned} K_{j,81}^{B71} &= C_{j,81} / P_{j,81}^{B71} \\ K_{81}^{B71} &= \sum_j K_{j,81}^{B71} \end{aligned} \quad (19)$$

Les dépenses en immobilisations par composante pour 1981, calculées sur la base 1981, sont définies par l'équation

$$\begin{aligned} K_{81}^{B81} &= \sum_j C_{j,81} \\ &= \sum_j (C_{j,81} / P_{j,81}^{B71}) \cdot P_{j,81}^{B71} \\ &= \sum_j (K_{j,81}^{B71} \cdot P_{j,81}^{B71}). \end{aligned} \quad (20)$$

Le rapport de K_{81}^{B81} à K_{81}^{B71} est

$$\begin{aligned} K_{81}^{B81} / K_{81}^{B71} &= \frac{\sum_j (K_{j,81}^{B71} \cdot P_{j,81}^{B71})}{\sum_j K_{j,81}^{B71}} \\ &= [\overline{P}_{81}]_{81}^{B71}. \end{aligned} \quad (21)$$

Par conséquent,

$$K_t^{B81} = [\overline{P}_{81}]_{81}^{B71} \cdot K_t^{B71}. \quad (22)$$

Or, pour la période 1961-1970,

$$K_t^{B71} = [\overline{P}_{71}]_{71}^{B61} \cdot K_t^{B61} \quad (23)$$

et donc,

$$K_t^{B81} = [\overline{P}_{71}]_{71}^{B61} \cdot [\overline{P}_{81}]_{81}^{B71} \cdot K_t^{B61}. \quad (24)$$

BRIEF EXPLANATION OF TERMS

Constant valuation measures values in constant prices.

Current valuation measures values in the prices of the given year.

Depreciation (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

Discards (retirements) are the value of gross investment that is withdrawn from the stock.

Gross fixed capital formation (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated³.

The investment expenditures are grouped by type of capital assets: building construction, engineering construction, and machinery and equipment. Engineering construction consists of items such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for military machinery and equipment by the Department of National Defence.

Gross stocks are the cumulative value of gross investment in capital goods less cumulative discards.

Net fixed capital formation (net investment) is gross fixed capital formation (gross investment) for a given year less deductions for the depreciation which has taken place on fixed capital assets purchased in previous years.

Net stocks are gross stocks less deductions for loss in value through physical deterioration and obsolescence.

Service life is the average length of time during which capital assets are present in useful economic production before retirement occurs.

BRÈVE EXPLICATION DES TERMES UTILISÉS

L'évaluation constante mesure les valeurs en dollars constants.

L'évaluation courante mesure les valeurs aux prix de l'année donnée.

L'amortissement (provision pour consommation de capital) est la prise en compte de la dégradation physique et de l'obsolescence.

Les mises hors service (mises à la réforme) correspondent à la valeur des investissements bruts retirés du stock.

La formation brute de capital fixe (Investissements bruts) correspond à la valeur des nouveaux biens corporels acquis par les branches d'activité dont on estime le stock³.

Les dépenses d'investissement sont classées par catégories d'immobilisations: construction de bâtiments, travaux de génie et machines et matériel. Les travaux de génie comprennent la construction de routes, de barrages, de lignes de transmission et de pipelines, ainsi que le forage de puits de pétrole et la mise en exploitation de mines. Dans la catégorie des machines et du matériel, les achats comprennent tous les articles utilisés pour la production de biens ou la prestation de services, mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments aratoires, le matériel professionnel et scientifique, le mobilier de bureau et de magasin et d'autres biens d'équipement de ce genre. On ne tient toutefois pas compte des montants consacrés à l'acquisition des machines et du matériel militaires par le ministère de la Défense nationale.

Les stocks bruts correspondent à la valeur cumulative des investissements bruts en biens d'équipement moins les mises hors service cumulatives.

La formation nette de capital fixe (Investissement net) correspond à la formation brute de capital fixe (investissement brut) pour une année donnée moins l'amortissement appliqué aux biens corporels achetés au cours des années précédentes.

Les stocks nets sont les stocks bruts dont on a déduit les pertes de valeur attribuables à la dégradation physique et à l'obsolescence.

La durée de vie est la période moyenne pendant laquelle les immobilisations contribuent utilement à la production économique avant d'être mises à la réforme.

³ The data are obtained from Statistics Canada, "Private and Public Investment in Canada, Intentions", Catalogue No. 61-205, and "Construction in Canada", Catalogue No. 64-201.

³ Les données sont tirées des publications de Statistique Canada intitulées "Investissements privés et publics au Canada, Perspective", n° 61-205 au catalogue, et "La construction au Canada", n° 64-201 au catalogue.

APPENDIX

This appendix presents a summary of the calculations used to produce these measures of capital stocks (Huang, 1988).

1. Gross capital stock

Gross capital stock is simply the sum over time of annual capital expenditures less the annual discards of worn out fixed assets.

$$GS_t = \sum_{i=t_0}^t (GI_i - D_i)$$

where

GS_t = gross capital stock in year t

GI_i = gross fixed capital formation in year i

D_i = discards in year i

t_0 = initial year.

2. Discards

Discards are the segments of earlier gross fixed capital formation that have reached the end of their useful life. While assets may be discarded at the end of their service life L , in reality, there is variation in the age at which identical assets are removed from the stock. To reflect this, the discard function follows a truncated normal distribution. This allows assets of the same age to be removed from the stock over a span of time rather than all at once.

$$D_i = \sum_{x=1}^{i-1} [GI_{x,L} \times W(L)_{x,i}]$$

where

D_i = the gross value of assets have reached the end of their useful life in year i

$GI_{x,L}$ = gross fixed capital formation of age x with service life L

$W(L)_{x,i}$ = the portion of investment of age x with service life L to be removed in year i .

3. Service life

The actual service life of an asset is a random variable reflecting quality differences, maintenance schedules, etc. The actual service lives are assumed to be normally distributed around the average service life \bar{L} with a standard deviation of $\bar{L}/4$. The distribution of the service lives can be represented by the standard normal distribution.

$$s = \bar{L}/4$$

ANNEXE

Cette annexe présente un résumé des calculs employés pour aboutir à ces mesures des stocks de capital (Huang, 1988).

1. Stock de capital brut

Le stock de capital brut correspond simplement à la somme des dépenses d'investissement annuelles moins les mises hors service annuelles d'immobilisations obsolescentes.

$$GS_t = \sum_{i=t_0}^t (GI_i - D_i)$$

où

GS_t = stock de capital brut à l'année t

GI_i = dépenses d'investissement brutes durant l'année i

D_i = mises hors service l'année i

t_0 = année initiale.

2. Mises hors service

Les mises hors service correspondent aux segments de la formation brute antérieure de capital fixe qui ont atteint la fin de leur durée de vie utile. Il se peut que les actifs soient mis hors service à la fin de leur durée de vie utile L , mais en réalité on constate une variation quant au moment auquel des actifs identiques sont retirés du stock. C'est pour cette raison que la fonction de mise hors service suit une distribution normale tronquée. De cette façon, la mise hors service des actifs d'une même génération peut être échelonnée sur un certain nombre d'années au lieu de se faire en même temps.

$$D_i = \sum_{x=1}^{i-1} [GI_{x,L} \times W(L)_{x,i}]$$

où

D_i = la valeur brute des actifs qui ont atteint la fin de leur durée de vie utile l'année i

$GI_{x,L}$ = formation brute du capital fixe de la génération x ayant une durée de vie utile L

$W(L)_{x,i}$ = portion des immobilisations de la génération x ayant une durée de vie L qui sera mise hors service l'année i .

3. Durée de vie

La durée de vie utile réelle d'un actif est une variable aléatoire qui reflète des différences quant à la qualité, aux calendriers d'entretien, etc. On suppose que cette variable aléatoire est distribuée de façon normale autour d'une moyenne de vie \bar{L} avec un écart type de $\bar{L}/4$. La distribution des durées de vie peut être représentée au moyen de la distribution normale type.

$$s = \bar{L}/4$$

where

$$P(L) = \left[\left(\frac{1}{s} \right) (2\pi)^{-1/2} \right] \times \text{EXP} \left[(-1/2) \left(\frac{(L - \bar{L})}{s} \right)^2 \right].$$

One property of the normal distribution is related to its infinite nature. Without adjustment, the distribution would yield cases where assets were discarded prior to their purchase or cases where assets had unrealistically long service lives. In order to eliminate these extremes, some adjustment is warranted to restrict the values of the actual service lives to a reasonable range around \bar{L} . This adjustment requires truncation of the normal distribution at some point before and after \bar{L} . The truncation is made at twice the standard deviation, thereby taking in 95% of the area under the standard normal distribution. Furthermore, the adjustment made is a horizontal truncation – raising the X -axis horizontally to intercept the normal distribution at the cut-off points. This truncation results in the area under the normal being one.

4. Net stock

Net stock of fixed assets is the gross stock of fixed assets less accumulated depreciation. It should be noted that when a fixed asset is fully depreciated, its value is zero in the net stock, thus reflecting its disposal.

$$NS_t = \sum_{i=t_0}^t NI_i$$

where

NS_t = net capital stock in year t

NI_i = net fixed capital formation in year i

t_0 = initial year.

5. Net fixed capital formation

Net fixed capital formation is the difference between the gross fixed capital formation and the total capital consumption allowance for year i .

$$NI_i = GI_i - \sum_x CCA_{i,x}$$

where

NI_i = net fixed capital formation in year i

GI_i = gross fixed capital formation in year i

$CCA_{i,x}$ = annual capital consumption allowance charged against assets of age x for year i .

6. Capital consumption allowance

Capital consumption allowance is the allowance made for physical deterioration and obsolescence.

$$CCA_{i,x} = GI_{(i-x+1)} \times DR_{i,x}$$

where

$CCA_{i,x}$ = capital consumption allowance charged in year i against an asset of age x

où

$$P(L) = \left[\left(\frac{1}{s} \right) (2\pi)^{-1/2} \right] \times \text{EXP} \left[(-1/2) \left(\frac{(L - \bar{L})}{s} \right)^2 \right].$$

Une des propriétés de la distribution normale est sa nature infinie. S'il n'y avait pas d'ajustement, la distribution produirait des cas de mise hors service avant même l'achat des actifs ou encore des cas de durée extraordinairement longue de ceux-ci. Afin d'éliminer ces cas extrêmes, il est justifié de concentrer les valeurs de la durée de vie réelle dans un intervalle raisonnable centré sur \bar{L} . Cet ajustement exige de tronquer la distribution normale à un certain point avant \bar{L} et à un autre, après \bar{L} . Ces points sont situés à deux écarts types de la moyenne, ce qui fait que 95 % de la surface totale est comprise sous la courbe de la distribution normale type. Il faut aussi tronquer la distribution sur le plan horizontal, c'est-à-dire remonter l'axe X de manière à ce qu'il croise la courbe normale aux points limites. Ainsi, la surface sous la courbe est égale à un.

4. Stock net

Le stock net des immobilisations est égal au stock brut moins l'amortissement accumulé. Notons que lorsqu'une immobilisation est entièrement amortie, sa valeur dans le stock net est nulle, ce qui correspond à sa mise hors service.

$$NS_t = \sum_{i=t_0}^t NI_i$$

où

NS_t = stock de capital net pour l'année t

NI_i = formation nette de capital fixe pour l'année i

t_0 = année initiale.

5. Formation nette de capital fixe

La formation nette de capital fixe correspond à la différence entre la formation brute de capital fixe et la provision pour consommation de capital pour l'année i .

$$NI_i = GI_i - \sum_x CCA_{i,x}$$

où

NI_i = formation nette de capital fixe l'année i

GI_i = formation brute de capital fixe l'année i

$CCA_{i,x}$ = provision annuelle pour consommation de capital créée pour les actifs de la génération x pour l'année i .

6. Provision pour consommation de capital

La provision pour consommation de capital est la provision faite pour tenir compte de l'usure et de l'obsolescence.

$$CCA_{i,x} = GI_{(i-x+1)} \times DR_{i,x}$$

où

$CCA_{i,x}$ = provision pour consommation de capital créée pour une immobilisation de la génération x pour l'année i

$GI_{(i-x+1)}$ = capital expenditures on fixed assets in year $(i - x + 1)$

x = age of asset in year i

$DR_{i,x}$ = depreciation rate in year i for fixed assets of age x .

$GI_{(i-x+1)}$ = dépenses en immobilisations l'année $(i - x + 1)$

x = âge des immobilisations l'année i

$DR_{i,x}$ = taux d'amortissement l'année i pour des immobilisations de la génération x .

7. Depreciation rates

Since the service lives for each type of fixed asset are allowed to vary between a minimum and a maximum value, each value of life over that span will face its own depreciation rates. To calculate the annual depreciation rate for a type of asset, the discard function is used to weight the individual depreciation rates for each value of L . There are three forms of depreciation used: geometric (declining balance), linear (straight line), and delayed methods.

$$DR_{i,x} = \sum_{L_{\min}}^{L_{\max}} (F(x,L) \times W(L)_{x,i})$$

where

$DR_{i,x}$ = depreciation rate for assets of age x in year i

$W(L)_{x,i}$ = portion of assets of age x with service life L in year i .

i) Geometric Depreciation Method

$$F(x,L) = \delta(1 - \delta)^{(x-1)}$$

$$\text{for } \delta = \left(\frac{2}{L}\right) \text{ and } L > 2$$

where

δ = decay function, which is a geometric or declining balance pattern, for assets of age x , whose service life is L

x = age of asset.

It should be pointed out that the geometric method has been normalized so that the full value of the asset is depreciated over the life of the asset rather than over an indefinite time span.

ii) Linear Depreciation Method

$$F(x,L) = \frac{1}{L}$$

where

L = service life.

iii) Delayed Depreciation Method

$$F(x,L) = \frac{L - (x - 1)}{L - \beta(x - 1)} - \frac{L - x}{L - \beta x}$$

where

7. Taux d'amortissement

Étant donné que les durées de vie pour chaque catégorie d'immobilisations peuvent varier entre une valeur minimale et une valeur maximale données, il existe des taux d'amortissement pour chaque valeur comprise dans cet intervalle. Dans le calcul du taux annuel d'amortissement pour une immobilisation, la courbe de mise hors service sert à la pondération des taux individuels de chacune des valeurs de sa vie utile L . Il y a trois formes d'amortissement qui peuvent être utilisées: l'amortissement géométrique (dégressif), linéaire (en ligne droite) ou différé.

$$DR_{i,x} = \sum_{L_{\min}}^{L_{\max}} (F(x,L) \times W(L)_{x,i})$$

où

$DR_{i,x}$ = taux d'amortissement des immobilisations d'âge x l'année i

$W(L)_{x,i}$ = portion des immobilisations d'âge x ayant une durée de vie utile L l'année i .

i) Amortissement géométrique

$$F(x,L) = \delta(1 - \delta)^{(x-1)}$$

$$\text{pour } \delta = \left(\frac{2}{L}\right) \text{ et } L > 2$$

où

δ = fonction de dégradation, de forme géométrique ou dégressive, pour des actifs à amortissement dégressif de la génération x , ayant une durée de vie L

x = âge de l'actif.

Signalons que l'amortissement géométrique a été normalisé de sorte que la valeur intégrale de l'actif est amortie sur la durée de vie de celui-ci plutôt que sur une période indéfinie.

ii) Amortissement linéaire

$$F(x,L) = \frac{1}{L}$$

où

L = durée de vie.

iii) Amortissement différé

$$F(x,L) = \frac{L - (x - 1)}{L - \beta(x - 1)} - \frac{L - x}{L - \beta x}$$

où

L = service life

x = age of asset

β = curvature parameter.

For structures, $\beta = 0,75$;

for machinery and equipment, $\beta = 0,5$.

The values given to β are the same as those used by the U.S. Bureau of Labor Statistics in their estimates of fixed capital stocks (U.S. Department of Labor, 1983).

8. Introduction of new service lives

It has been the practice of virtually all countries that publish capital stock estimates to assume a service life that remains constant over time⁴. A major change in these new estimates has been the adoption of mean vintage lives that fall from year to year.

The new life pattern is fixed (for each industry and asset class) by two data points, the "old life" used hitherto in our estimates, ascribed to some vintage in the past, and a new 1987 value based on expected lives reported in the annual capital expenditure survey. An asset's life has two ends, "birth" (vintage) and "death" (discard). It is the decision to discard a capital good which primarily determines its life. Moreover, this life can be established accurately only at the time of discarding. At birth, life is merely an "expected life".

The pattern of life change is shown in the following diagram:

Figure 2. Pattern of service life change

L = durée de vie

x = âge de l'actif

β = paramètre de courbe.

Pour les ouvrages $\beta = 0,75$

pour les machines et le matériel $\beta = 0,5$.

Les valeurs données à β sont les mêmes que celles qu'utilise le Bureau of Labor Statistics des États-Unis pour ses estimations du stock de capital fixe (U.S. Department of Labor, 1983).

8. Introduction de nouvelles durées de vie

Presque tous les pays qui publient des estimations du stock de capital ont pour pratique de supposer une durée de vie qui demeure constante dans le temps⁴. Ces nouvelles estimations traduisent un changement important, soit l'application aux générations d'immobilisations de durées de vie moyennes décroissantes.

La nouvelle courbe de durée de vie est fixée (pour chaque branche d'activité et pour chaque catégorie d'actifs) par deux points, c'est-à-dire "l'ancienne durée", utilisée jusqu'ici dans nos estimations et attribuée par le passé à certaines générations d'actifs, et une nouvelle valeur, adoptée en 1987 et fondée sur les durées de vie escomptées signalées dans l'enquête annuelle sur les dépenses en immobilisations. On estime donc que la durée de vie d'un bien a des extrémités, c'est-à-dire une "naissance" (génération) et une "mort" (mise hors service). C'est la décision de mettre une immobilisation hors service qui détermine surtout la durée de vie de celle-ci. De plus, on ne peut préciser cette durée de vie qu'au moment de la mise hors service. À la "naissance", il s'agit uniquement d'une durée de vie "escomptée".

Le diagramme suivant présente l'évolution de la durée de vie :

Figure 2. Évolution de la durée de vie

⁴ The U.K. and Australia have recently adopted falling service lives.

⁴ Le R.-U. et l'Australie ont adopté récemment des durées de vie décroissantes.

The old lives, "OL" on the diagram, were based on evidence gathered in the U.S. in the 1930's. The assumption made in the calculation of these estimates is that since 1947, starting with the postwar recovery, discard ages have progressively fallen, i.e., that in each year it is decided to terminate asset life at an earlier age than in the previous year. For the period before 1947, it has been assumed that discard ages were unchanging.

The model that calculates capital stock uses not discard ages, but vintage lives. The vintage year corresponding to 1947 is 1947 minus "old life". If the old life was 40 years, the corresponding vintage was 1907. Thus 1907 gives the point in this example at which the service lives in the new capital estimates begin to fall. The second data point is simply the 1987 surveyed expected life.

A major decision, given these two data points, is the choice of the shape of the curve which connects them. Given a lack of sufficiently strong evidence to the contrary, what appeared to be the most neutral assumption was made, namely, that the fall in lives is a constant annual percentage (i.e. "geometric"). This geometric rate is

$$R = \left[\frac{NL}{OL} \right]^{\frac{1}{A}} - 1$$

where

A is $(1987 - T_o)$, or $(OL + 40)$ since T_o is $(1947 - OL)$.

For example, if the 1987 life (NL) is 20, and the old life is 40, then

$$R = \left[\frac{20}{40} \right]^{\frac{1}{80}} - 1$$

$$= -0.00863 \text{ or } -0.863\% \text{ per year.}$$

It has been assumed that after 1987, vintage life continues to fall at the same geometric rate. This assumption may eventually be revised if warranted by the evidence of future annually surveyed lives.

Les anciennes durées de vie, "OL" sur le diagramme, étaient basées sur des éléments de preuve réunis aux États-Unis dans les années 1930. L'hypothèse sur laquelle est fondé le calcul de ces estimations est que, depuis 1947, c'est-à-dire depuis la relance de l'après-guerre, l'âge à la mise hors service a progressivement diminué, c'est-à-dire que chaque année, l'âge auquel les actifs sont mis hors service est plus bas que l'année précédente. Avant 1947, on supposait que cet âge ne changeait pas.

Le modèle employé pour calculer le stock de capital utilise non pas l'âge à la mise hors service, mais plutôt l'âge de la génération. L'âge de la génération correspondant à 1947 est 1947 - "l'ancienne durée de vie". Si l'ancienne durée de vie était de 40 ans, la génération correspondante était 1907. Dans cet exemple, 1907 correspond donc au point auquel la durée de vie, dans les nouvelles estimations du capital, commence à diminuer. Le second point est tout simplement la durée de vie escomptée lors de l'enquête de 1987.

Ces points étant posés, il s'agit ensuite de déterminer la forme de la courbe qui les relie. Vu l'absence de preuves suffisamment fortes du contraire, on a adopté l'hypothèse en apparence la plus neutre, à savoir que la durée de vie baisse à un pourcentage annuel constant (c.-à-d., "géométrique"). Ce taux géométrique est le suivant:

$$R = \left[\frac{NL}{OL} \right]^{\frac{1}{A}} - 1$$

où

A est $(1987 - T_o)$, ou $(OL + 40)$ étant donné que T_o est $(1947 - OL)$.

Par exemple, si la durée de vie pour 1987 (NL) est 20 et que l'ancienne durée de vie est 40, alors

$$R = \left[\frac{20}{40} \right]^{\frac{1}{80}} - 1$$

$$= -0.00863 \text{ ou } -0.863\% \text{ par année.}$$

On suppose qu'après 1987, la durée de vie d'une génération d'immobilisations continue de diminuer au même taux géométrique. Il se peut que cette hypothèse soit tôt ou tard révisée si les durées de vie observées annuellement dans l'avenir le justifie.

Applications of the Use of Capital Stock Estimates in Economic Analysis

Production Functions

The theory of production as presented in any micro-economic textbook (e.g. Varian, 1989) is at the core of economic analysis, explaining why methods of production differ sharply both within and across industries and countries. A production function is a mathematical relationship based on this theory that specifies output to be determined by labour, capital and other inputs. While in the short run, capital is fixed, given sufficient time to adjust, optimizing firms will choose the capital inputs that minimize the costs of production at output levels that maximise profits.

Many different production functions are used in economic analysis. The simplest is the Leontief or fixed coefficient function. It assumes that capital must always be used in exactly the same proportions to all other input factors with the result that increases in production require a proportionate increase in all input factors. While this assumption of fixed factor proportions may be appropriate for some purposes such as input-output analysis, it is generally agreed that in most industries it is possible to substitute one factor of production for another within a certain range (i.e. to use more labour and less machines or vice versa).

The Cobb-Douglas production function assumes a flexible relationship between input factors. One of its major shortcomings, however, is that it requires the capital share (defined as the stock of capital times its cost) to remain a fixed proportion of the value of production. For this reason, this production function is more often used at the macroeconomic level, where this empirical regularity is observed. For individual industries, where capital shares tend to vary with changes in factor prices, other production functions such as the Constant Elasticity of Substitution (CES) are usually more appropriate, since, unlike the Cobb-Douglas, they allow factor shares to vary when factor prices change. An even more complicated production function that allows the elasticity of substitution to vary as the ratios of factor inputs change is the Translog Cost function.

Extensive research has been conducted in estimating the parameters of these functions (Diewert, 1973, Denny, 1980). Given the importance of capital as an input in the production function, the functions can only be fully representative if based on good estimates of capital stock.

Applications de l'utilisation des estimations du stock de capital dans l'analyse économique

Fonctions de production

La théorie de la production qui est présentée dans tout manuel de micro-économie (Varian, 1989) est au cœur de l'analyse économique. Elle explique pourquoi les méthodes de production diffèrent fortement à la fois à l'intérieur des branches d'activité et des pays et entre eux. Une fonction de production est une relation mathématique basée sur cette théorie qui précise la production qui est déterminée par le travail, le capital et d'autres facteurs de production. Alors qu'en courte période le capital est fixe, avec suffisamment de temps pour s'adapter, les firmes optimisantes vont choisir des facteurs de production de capital qui minimisent les coûts de production à des niveaux de production qui maximisent les profits.

L'analyse économique utilise de nombreuses fonctions de production différentes. La fonction de production la plus simple est celle de Leontief, dite à coefficients fixes. Elle suppose que le capital doit toujours être utilisé exactement dans les mêmes proportions par rapport à tous les autres facteurs de production, de sorte que l'augmentation de la production nécessite une augmentation proportionnelle de tous les facteurs. Bien que cette hypothèse de fixité des proportions des facteurs puisse convenir à certaines fins telles que l'analyse entrées-sorties, on convient en général que, dans la plupart des branches d'activité, il est possible de substituer un facteur de production à un autre à l'intérieur d'un certain intervalle (utiliser plus de travail et moins de machines, ou inversement).

La fonction de production de Cobb-Douglas suppose une relation souple entre les facteurs de production. Un de ses principaux inconvénients, par contre, est que la part de capital (définie comme le stock de capital multiplié par son coût) doit demeurer une proportion fixe de la valeur de la production. Pour cette raison, cette fonction de production sert plus souvent au niveau macro-économique, où l'on observe cette régularité empirique. Pour les branches d'activité considérées isolément, où la part du capital a tendance à varier suivant les variations des prix des facteurs, d'autres fonctions de production, comme celle de l'élasticité constante de substitution (ECS) conviennent en général mieux, puisque, contrairement à la fonction de Cobb-Douglas, elles permettent aux parts des facteurs de varier lorsque les prix des facteurs changent. Une fonction de production encore plus compliquée, qui permet à l'élasticité de substitution de varier comme le ratio des variations des facteurs de production, est la fonction de coût Translog.

On a effectué des recherches poussées pour estimer les paramètres de ces fonctions (Diewert, 1973, Denny, 1980). Compte tenu de l'importance du capital comme facteur dans la fonction de production, les fonctions ne peuvent être réellement représentatives si elles ne sont pas basées sur une bonne estimation du stock de capital.

Productivity and Competitiveness

Productivity is a key concept in economics because it measures the efficiency of production. It is, thus, a determinant of the output of individual industries and indeed of the entire economy. The higher the level of productivity, the greater the income generated by a given supply of factor inputs. Productive efficiency also helps counter inflationary pressures by restraining increases in costs resulting from factor price increases.

Productivity is the determinant of an economy's costs of production and its ability to compete in international markets. The emergence of low cost suppliers and changes in comparative advantage among industrialized countries have recently highlighted the importance of productivity growth and improvements in the use of resources.

Conceptually, productivity can be measured in two ways. Productivity can be gauged by comparing output to a single factor input such as capital, labour or energy (partial factor productivity) or against all the input factors that go to produce the product (total factor productivity). One measure of partial factor productivity is the productivity of capital, defined as output per unit of capital input. An improvement in output relative to capital input thus reflects an increase in the productivity of capital.

Labour productivity tends to grow over the long-term as workers become better trained, educated, and equipped with better capital. In the short-term, labour productivity changes systematically with the business cycle. The cyclical behaviour of labour productivity is explained by lags in the adjustment of labour input to cyclical changes in output. This reflects unanticipated changes in demand and the existence of overhead labour. For example, during a recession, labour productivity falls as firms are unable or reluctant to lay off staff as output falls, and during a recovery, labour productivity increases as firms are slow to hire back workers as excess capacity is taken up.

Partial factor productivity, however, is a simplistic portrayal of the production process since no allowance is made for the contribution of the other factor inputs. A higher productivity of labour does not necessarily mean greater overall productivity. It could simply reflect the substitution of other inputs, such as capital, for labour in response to changes in relative input prices. A more comprehensive measure, total factor productivity, is based on a formal production function which takes into account all the inputs to production (labour, land, energy, materials).

Total factor productivity can be defined as the efficiency with which all productive inputs are combined to produce goods and services. It is much more complex to measure, requiring information on the prices and the quantities of all factor inputs as well as output. Total factor productivity increases if there is an improvement in the efficiency with which inputs are combined to produce output through, for example, improved technology. Total factor productivity is thus the best expression of the efficiency of economic production and the prospects for longer term increases in output.

Productivité et compétitivité

La productivité est un concept fondamental de l'économie parce qu'elle mesure l'efficacité de la production. Elle est donc un déterminant de la production des branches d'activité et, en fait, de l'économie toute entière. Plus le niveau de productivité est élevé, et plus le revenu généré par une offre donnée de facteurs de production l'est aussi. L'efficacité peut également contribuer à atténuer les pressions inflationnistes en limitant les augmentations de coût résultant de l'accroissement du prix des facteurs.

La productivité est le déterminant des coûts de production d'une économie et de sa capacité à soutenir la concurrence sur les marchés internationaux. L'apparition de fournisseurs à bas coûts et les changements de l'avantage comparatif entre les pays industrialisés ont récemment mis en valeur l'importance de la croissance de la productivité et de l'amélioration de l'utilisation des ressources.

La productivité peut être théoriquement mesurée de deux façons. Il est possible de l'évaluer en comparant la production à un facteur unique de production tel que le capital, le travail ou l'énergie (productivité partielle des facteurs), ou à tous les facteurs de production qui servent à produire le bien ou le service en question (productivité totale des facteurs). Une mesure de productivité partielle est la productivité du capital, qu'on définit comme la production par unité du facteur de production capital. Une amélioration de la production par rapport au capital traduit donc une augmentation de la productivité de ce dernier.

La productivité du travail a tendance à croître à long terme à mesure que les travailleurs sont mieux formés, éduqués et dotés d'un meilleur capital. À court terme, les variations de la productivité du travail fluctuent systématiquement avec le cycle économique. Le comportement cyclique de la productivité du travail s'explique par des retards dans l'ajustement du travail aux variations cycliques de la production. Ceci traduit des variations non prévues de la demande et l'existence de coûts généraux du travail. Pendant une récession, par exemple, la productivité du travail diminue alors que les entreprises ne sont pas en mesure, ou évitent, de mettre à pied leur personnel au moment où la production diminue, et pendant les reprises, la productivité du travail augmente à mesure que les entreprises prennent leur temps pour réembaucher les travailleurs, alors que la capacité excédentaire disparaît.

La productivité partielle des facteurs, par contre, est une image simpliste du processus de production, puisqu'on ne tient pas compte de la contribution des autres facteurs de production. Une productivité du travail plus élevée ne signifie pas nécessairement une plus grande productivité générale, puisqu'elle pourrait simplement traduire la substitution d'autres facteurs tels que le capital au travail en réaction à des fluctuations des prix relatifs des facteurs de production. Une mesure plus complète, la productivité totale des facteurs, repose sur une fonction de production formelle qui prend en compte tous les facteurs de production (travail, terre, énergie, matières).

On peut définir la productivité totale des facteurs comme l'efficacité avec laquelle tous les facteurs de production sont combinés pour produire des biens et des services. Elle est beaucoup plus complexe à mesurer, car elle nécessite des renseignements sur les prix et les quantités de tous les facteurs, ainsi que sur la production. La productivité totale des facteurs augmente s'il y a une amélioration de l'efficacité avec laquelle les facteurs sont combinés pour réaliser le produit, grâce à une amélioration de la technologie, par exemple. La productivité totale des facteurs est donc la meilleure expression de l'efficacité de la production économique et des perspectives d'une augmentation à plus long terme de la production.

Numerous studies have been conducted to determine the causes of changes in total factor productivity over time, particularly focusing on the productivity slowdown of the early 1970s. Someshwar Rao (1983), for example, suggested that the slowdown in productivity of the 1970s was linked to the world-wide slowdown in aggregate demand and the substantial increase in the relative price of capital, energy and material. John Helliwell (1984) similarly found that the slowdown in labour productivity growth could be explained by changes in factor proportions, demand and profitability that were due to changes in world oil prices and parallel changes in inflation and real output in other countries. In its Seventeenth Annual Review, the Economic Council of Canada (1980) attributed the slowdown at the sectoral level to a reduction in the growth of capital and intermediate inputs in relation to labour input.

Since capital constitutes one of the factor inputs in total factor productivity, the reliability of this measure depends critically on the quality of capital stock data. In Canada and other capital-intensive industrialized countries, these productivity estimates are particularly important because of the relatively large role of capital in the production process. In contrast, many developing countries are less capital-intensive and capital plays a smaller role.

Technological Progress

In production theory, technological progress, or the growth of total factor productivity, is estimated as a residual from the production function. This is the amount by which output increases as a result of improvements in methods or techniques of production after accounting for all the increase in output attributable to increases in factor inputs. Technological progress is said to occur when output increases more rapidly than can be explained by increases in factors of production. Such estimates of technological change require good estimates of capital stock.

This approach to measuring technological change was pioneered by Robert Solow (1957) and subsequently by Edward Denison (1974). From the aggregate production function, Solow separated variations in output per labour-hour due to technical change from those due to changes in the availability of capital per labour-hour. His conclusion was that over 80% of the growth in output per labour-hour over the 1909-1949 period could be attributed to technical progress. Denison used an equation that isolated technical progress from changes in labour and capital growth to measure output growth. His findings for the 1929-1982 period support Solow's estimate that most of the growth in output per labour-hour is due to technological progress.

The methods used by Denison have been applied to Canadian data for the period 1946 to 1967 in a study conducted by the Economic Council of Canada in its Seventh Annual Review (1970), which concluded that technical progress accounted for almost half of the growth in output. While it is recognized

De nombreuses études ont été faites pour déterminer les raisons des variations de la productivité totale des facteurs dans le temps, en s'attachant particulièrement au ralentissement de la productivité du début des années 1970. Ainsi, Someshwar Rao (1983) suggère que le ralentissement de la productivité dans les années 70 se rattache au ralentissement à l'échelle mondiale de la demande globale et à l'augmentation appréciable du prix relatif du capital, de l'énergie et des matières. John Helliwell (1984) devait également constater que le ralentissement de la croissance de la productivité du travail pouvait s'expliquer par des changements dans les proportions des facteurs, de la demande et de la profitabilité résultant des fluctuations des prix mondiaux du pétrole et des fluctuations simultanées de l'inflation et de la production réelle dans les autres pays. Dans sa dix-septième revue annuelle, le Conseil économique du Canada (1980) attribue le ralentissement au niveau sectoriel à une réduction de la croissance des entrées de capital et intermédiaires par rapport au travail.

Comme le capital constitue un des facteurs de production dans la productivité totale des facteurs, la fiabilité des estimations de cette mesure dépend avant tout de la qualité des données sur le stock de capital. Au Canada et dans les autres pays industrialisés à intensité de capital, ces estimations de productivité sont particulièrement importantes en raison du rôle relativement important du capital dans le processus de production. Par contre, de nombreux pays en développement sont à moindre intensité de capital, et le capital joue un rôle moins important.

Progrès technologique

Dans la théorie de la production, on estime le progrès technologique ou la croissance de la productivité totale des facteurs comme un résidu de la fonction de production. C'est l'accroissement de la production à la suite d'une amélioration des méthodes ou des techniques de production, après prise en compte de toute l'augmentation de la production attribuable à l'accroissement des facteurs de production. On dit qu'il y a progrès technologique lorsque la croissance de la production est plus rapide que celle qui aurait pu être expliquée par l'accroissement des facteurs de production. De telles estimations du changement technologique nécessitent de bonnes estimations du stock de capital.

C'est Robert Solow (1957) et, plus tard, Edward Denison (1974), qui ont été les pionniers de cette méthode de mesure de l'évolution technologique. À partir de la fonction globale de production, Solow a séparé les variations de la production par heure-travail résultant de l'évolution technique de celles résultant des changements de la disponibilité du capital par heure-travail. Il devait conclure que plus de 80 % de la croissance de la production par heure-travail au cours de la période 1909-1949 pouvait s'expliquer par le progrès technique. Denison utilise une équation qui isole le progrès technique des variations de la croissance du travail et du capital afin de mesurer la croissance de la production. Ses conclusions pour la période 1929-1982 confirment l'estimation de Solow selon laquelle la plus grande partie de la croissance de la production par heure-travail est imputable au progrès technologique.

Les méthodes de Denison ont été appliquées aux données canadiennes pour la période 1946-1967 dans une étude que le Conseil économique du Canada a présentée dans sa septième revue annuelle (1970). Il devait conclure que le progrès technique représentait près de la moitié de la croissance de la production. Bien que l'on admette

that technological change has always been a fact of industrial life, what distinguishes the present environment is the tremendous pace of change and its pervasive impact on the marketplace. New studies of technological progress will be able to take advantage of the estimates of the capital stock now available.

This growing importance of technological progress has led Statistics Canada to include questions on technology and automation in the Capital and Repair Expenditures Survey. Information on reasons for discards and on sales and purchases for used assets, for example, provides direct evidence on when assets are retired prematurely in response to changes in technology or factor prices.

Automation by Industry

For a high-wage country like Canada, in a highly competitive global economy, it is useful to know the extent to which industry is automated and the speed with which new automated equipment is introduced. The Survey of Capital and Repair Expenditures contains detailed information on expenditures for automation including spending on robots, automated material-handling equipment, automated production machinery and equipment, and computerized, numerically controlled machine tool equipment. This information on automation also helps to shed light on the nature and form of technological progress.

The rapid growth in expenditures on automation equipment over the last decade reflects the concern of industries to increase productivity, and to ensure their future competitiveness. A high level of automation also allows an industry to produce goods that have a high value per unit of labour and hence to pay high wages. There is a concern that automation will eliminate jobs. But any failure to match the efforts of our main partners in introducing cost-reducing automation could have a far greater impact on employment, through the loss in international competitiveness, than from labour displacement resulting from the adoption of automated equipment. The new information of capital spending on automation is essential to monitor the competitiveness of the Canadian economy and the impact of automation.

Potential Output

Potential output is an important indicator for macroeconomic policy. It measures the amount of goods and services that an economy can produce when all factors of production are fully employed. This occurs when the economy is operating at a high level of demand, usually defined to be a business cycle peak.

Potential output is estimated in the production function by determining the full-employment levels of capital, labour and other input factors. Reliable estimates of potential output therefore depend on accurate estimates of the capital stock, since capital constitutes one of the main inputs determining potential output.

que l'évolution technologique ait toujours été une partie intégrante de la vie industrielle, ce qui distingue l'environnement actuel, ce sont le rythme extraordinaire de variation et son incidence générale sur le marché. De nouvelles études du progrès technologique seront en mesure de bénéficier des estimations du stock de capital qui sont maintenant disponibles.

L'importance croissante du progrès technologique a poussé Statistique Canada à inclure des questions sur la technologie et l'automatisation dans l'Enquête sur les dépenses en immobilisations et en réparations. Les renseignements sur les causes de la mise hors service et sur les ventes et les achats d'actifs usagés, par exemple, fournissent une preuve directe de la date du retrait prématuré des actifs en raison de l'évolution de la technologie ou du prix des facteurs.

Automatisation par branche d'activité

Dans un pays aux salaires élevés comme le Canada, dans une économie globale hautement concurrentielle, il est bon de connaître dans quelle mesure chaque branche est automatisée et la rapidité d'installation du nouveau matériel automatisé. L'Enquête sur les dépenses en immobilisations et en réparations contient des renseignements détaillés sur les dépenses pour l'automatisation, ce qui comprend celles pour les robots, le matériel de manipulation de matériel automatisé, les machines et le matériel de production automatisés ainsi que le matériel sous forme de machines-outils contrôlés de façon numérique et informatisée. Ces renseignements sur l'automatisation permettent de préciser la nature et la forme du progrès technologique.

La croissance rapide des dépenses au titre du matériel d'automatisation au cours des dix dernières années traduit le souci des branches d'activité d'accroître leur productivité et de garantir leur compétitivité future. Un niveau élevé d'automatisation permet également à une branche d'activité de produire des biens qui ont une valeur par unité de travail élevée, et par conséquent, de payer des salaires élevés. On s'inquiète de ce que l'automatisation supprime des emplois. Mais l'incapacité de réagir aux efforts de nos principaux partenaires par la mise en service d'un matériel automatisé qui réduirait les coûts pourrait avoir un impact beaucoup plus fort sur l'emploi, sous la forme d'une perte de la compétitivité internationale, qu'un déplacement de main-d'œuvre causé par la mise en service de matériel automatisé. Les nouveaux renseignements sur les dépenses en immobilisations au titre de l'automatisation sont essentiels pour suivre la compétitivité de l'économie canadienne et l'impact de l'automatisation.

Production potentielle

La production potentielle est un important indicateur de la politique macro-économique. Elle mesure la quantité des biens et des services qu'une économie peut produire lorsque tous les facteurs de production sont employés complètement. C'est ce qui se produit lorsque l'économie fonctionne en période de forte demande, que l'on définit habituellement comme le sommet du cycle économique.

On estime la production potentielle dans la fonction de production par la détermination des niveaux de plein emploi des facteurs capital, travail et autres. Des estimations fiables de la production potentielle pourraient par conséquent dépendre d'estimations précises du stock de capital, puisque le capital constitue l'un des principaux facteurs qui déterminent la production potentielle.

The gap between actual and potential output provides an indication of how much room there is for the economy to grow before it starts to run into capacity constraints and inflationary pressures are generated. An output measure that is closely related to potential output is cyclically-adjusted output which is defined as output produced at an average level of activity rather than at a business cycle peak.

Estimates of potential output and cyclically adjusted output are often used in macroeconomic forecasting models such as those of the Department of Finance or the Bank of Canada or of private forecasting firms such as DRI, WEFA, the Conference Board or Informetrica. These models are, in turn, used to forecast economic growth, and to guide policy-makers in the development of stabilization policies.

Capacity Utilization

Good estimates of capacity utilization are needed for sound macroeconomic management. Measures of capacity utilization help policy-makers identify bottlenecks in industries where price pressures are likely to emerge. They are also useful in assessing future demand for business investment in plant and equipment, and in analyzing the effects of aggregate demand pressure on the balance of payments. In addition, capacity utilization is an important factor determining industry's response to interest rate changes and government spending.

To meet these needs, Statistics Canada publishes data on industrial capacity utilization rates at the two-digit Standard Industrial Classification level of detail. Estimates of capacity utilization are built up from data on output (quarterly gross domestic product in constant dollars and seasonally adjusted) and capital stock (constant dollar net fixed capital stock). The methodology involves the estimation of trends in capital productivity, the use of surveyed estimates of annual capacity utilization rates to anchor the level of capacity utilization estimates, and a reliance on sectoral indicators of market tightness to validate the broad movements of capacity utilization rates. This information in turn is used to estimate capacity output-capital ratios. Capacity output by industry is then estimated by multiplying the capital stock in each quarter by its corresponding capacity output-capital ratio. Capacity utilization by industry is calculated by dividing actual output in the industry by capacity output.

The methodology reflects the combined and reconciled methodologies of both the Bank of Canada and Statistics Canada. In 1992 Statistics Canada assumed full responsibility for publishing official estimates of capacity utilization. This eliminated the previous duplication of capacity utilization series that had been a source of confusion for users of the data.

L'écart entre la production réelle et la production potentielle donne une indication de la marge de manoeuvre de l'économie pour croître avant qu'elle ne se heurte à des contraintes de capacité et que les pressions inflationnistes n'apparaissent. Une mesure de la production qui est étroitement rattachée à la production potentielle est la production corrigée du cycle, que l'on définit comme la production à un niveau moyen d'activité, plutôt qu'au sommet du cycle économique.

Des estimations de la production potentielle et de la production corrigée du cycle servent souvent dans les modèles de prévision macro-économiques tels que ceux du ministère des Finances ou de la Banque du Canada, ou d'entreprises de prévision privées comme DRI, WEFA, le Conference Board ou Informetrica. Ces modèles sont à leur tour utilisés pour prévoir la croissance économique et pour diriger les décideurs dans l'élaboration de politiques de stabilisation.

Utilisation de la capacité

De bonnes estimations de l'utilisation de la capacité sont nécessaires pour une gestion macro-économique saine. Les mesures de l'utilisation de la capacité aident les décideurs à identifier les goulots d'étranglement dans les branches d'activité où des pressions sur les prix vont probablement apparaître. Ces méthodes sont également utiles lorsqu'il s'agit d'évaluer la demande future d'investissements des entreprises en usines et matériel et pour analyser les effets de la pression de la demande globale sur la balance des paiements. Par ailleurs, l'utilisation de la capacité est un important facteur dans la détermination de la réaction de la branche d'activité aux fluctuations des taux d'intérêt et des dépenses publiques.

Pour répondre à ces besoins, Statistique Canada publie des données sur les taux d'utilisation de la capacité dans les branches d'activité au niveau à deux chiffres de la Classification type des industries. Les estimations de l'utilisation de la capacité sont établies à partir des données sur la production (produit intérieur brut trimestriel en dollars constants et désaisonnalisés) et du stock de capital (stock de capital fixe net en dollars constants). Cette méthodologie comprend : l'estimation des tendances de la productivité du capital, l'utilisation des estimations d'enquête des taux d'utilisation de la capacité annuels afin de caler le niveau des estimations d'utilisation de la capacité, l'utilisation d'indicateurs sectoriels du resserrement du marché afin de valider les mouvements généraux des taux d'utilisation de la capacité. Ces renseignements servent à leur tour à estimer des ratios de la production à pleine capacité au capital. La production à pleine capacité par branche d'activité est ensuite estimée par la multiplication du stock de capital au cours de chaque trimestre par le ratio correspondant de la production à pleine capacité au capital. On obtient l'utilisation de la capacité par branche d'activité en divisant la production réelle de la branche par la production à pleine capacité.

Cette méthodologie prend en compte les méthodologies combinées et rapprochées de la Banque du Canada et de Statistique Canada. En 1992, Statistique Canada a assumé la pleine responsabilité de la publication des estimations officielles de l'utilisation de la capacité. Ceci devait éliminer les doubles comptes précédents des séries d'utilisation de la capacité qui étaient une source de confusion pour les utilisateurs des données.

Depreciation for Tax Policy

Economic depreciation, defined as an asset's loss in monetary value with age, has always been a key issue for economists (see Dale W. Jorgenson, 1971; Hulten and Wykoff, 1981) and is important for tax policy. While public policy can sometimes favour one industry or asset type over another, as a general rule, the best corporate tax policy is one that is neutral and imposes the same tax burden on all industries. Higher tax burdens on some industries and assets create distortions resulting in misallocations in capital and lower output and productivity.

The federal government introduced major corporate tax changes in 1988. Some of the changes were designed to reduce the divergence for many asset classes between capital cost allowances and economic depreciation — particularly in the manufacturing sector. In most cases, capital cost allowances were reduced, and for manufacturing and processing machinery and equipment, the two-year write-off was transformed into a three-year write-off by the imposition of a rule that allowed only half of the full write-off to be taken in the year of acquisition.

To ensure that the corporate tax is neutral requires good estimates of economic depreciation and service lives that can be used in setting capital cost allowances for tax purposes. For corporate tax policy, the government had traditionally relied on U.S. data for service lives. Now, however, given the vast improvements made in this area, such estimates are available from Statistics Canada's Capital and Repair Expenditures Survey.

Wealth

National wealth is the aggregate of all the domestic sectors' tangible assets. These include residential and non-residential structures, machinery and equipment, consumer durables (washing machines, televisions, stereos), inventories and land. Capital stock is thus an important component of national wealth.

Financial assets such as currency and bank deposits, and foreign investments are not included. The value of stocks, bonds, mortgages and equities is not included either, since such financial assets are claims on the tangible wealth held by corporations or individuals and their value has therefore already been included in the measures of capital stock and consumer durables.

Measures of national wealth are provided in the National Balance Sheet Accounts of Statistics Canada (a component of the Canadian System of National Accounts). The importance of capital stock as a component of national wealth is highlighted by the fact that it accounts for approximately 15% of Canadian total assets, and for 38% of all tangible assets (National Balance Sheet Accounts, Catalogue No. 13-214P, 1992).

Amortissement aux fins de la politique fiscale

L'amortissement économique, défini comme la perte de la valeur monétaire d'un actif avec l'âge, a toujours été une question importante pour les économistes (voir Dale W. Jorgenson, 1971; Hulten and Wykoff, 1981) et elle est importante aux fins de la politique fiscale. Bien que la politique publique puisse parfois favoriser une branche ou un actif à rapport à un autre, en règle générale la politique fiscale des sociétés qui est la meilleure est celle qui est neutre et qui impose le même fardeau fiscal à toutes les branches d'activité. Un fardeau fiscal plus lourd sur certaines branches et certains actifs entraîne des distorsions qui se traduisent par une mauvaise répartition du capital et par une diminution de la production et de la productivité.

Le gouvernement fédéral a apporté d'importants changements à l'impôt sur les sociétés en 1988. Certains de ces changements étaient destinés à réduire la divergence pour un grand nombre de catégories d'actifs entre les provisions pour consommation de capital et l'amortissement économique, en particulier dans le secteur de la fabrication. Dans la plupart des cas, des provisions pour consommation de capital ont été réduites et, pour les machines et le matériel de fabrication et de transformation, la période d'amortissement a été portée de deux à trois ans par l'imposition d'une règle qui prévoyait que la moitié seulement de l'amortissement complet pouvait être prise en compte pendant l'année d'acquisition.

Pour que l'impôt sur les sociétés soit neutre, il faut disposer de bonnes estimations de l'amortissement économique et des durées de vie utile qui peuvent servir à établir les provisions pour consommation de capital aux fins fiscales. Dans le cas de la politique fiscale des sociétés, le gouvernement a en règle générale utilisé des données américaines pour les durées de vie utile. Toutefois, en raison des grands progrès réalisés dans ce domaine, il est possible d'obtenir ces estimations à partir de l'Enquête sur les dépenses en immobilisations et en réparations de Statistique Canada.

Richesse

La richesse nationale est l'agrégat des actifs corporels de tous les secteurs intérieurs. Ces actifs comprennent les bâtiments résidentiels et non résidentiels, les machines et le matériel, les biens de consommation durables (machines à laver, téléviseurs, stéréos), les stocks et la terre. Le stock de capital est donc une importante composante de la richesse nationale.

Les actifs financiers tels que les devises et les dépôts bancaires ainsi que les investissements étrangers ne sont pas pris en compte. La valeur des actions, des obligations, des hypothèques et des titres n'est pas non plus prise en compte, puisque ces actifs financiers sont des créances sur la richesse corporelle des sociétés ou des particuliers et parce que leur valeur est déjà incluse dans les mesures du stock de capital et des biens de consommation durables.

On trouve les mesures de la richesse nationale dans les comptes du bilan national de Statistique Canada, qui est une composante du système canadien de comptabilité nationale. L'importance du stock de capital comme composante de la richesse nationale est mise en relief par le fait qu'il représente environ 15 % du total des actifs du Canada et 38 % de tous les actifs corporels (Comptes du bilan national, n° 13-214P au catalogue, 1992).

Capital Intensity by Industry

Accurate estimates of capital stock are required to determine the investment needs of individual industrial sectors.

Capital stock data can be used in conjunction with information on the cost of capital and the cost of labour in various industry sectors to determine which industries offer the greatest economic potential. For example, Canada, in comparison to under-developed countries, has a relatively low cost of capital and expensive labour costs and therefore tends to specialize in capital-intensive, rather than labour-intensive, industries.

For tax policy, capital stock estimates by industry also provide useful information to determine the cost of and need for investment tax credits. Capital intensive industries, that require more capital investment and that may need assistance in the form of investment tax credits, can be identified.

In addition, estimates of capital stocks are useful for financial institutions in carrying out overall assessments of the need for financing of the various industrial sectors of the economy. Inaccurate capital stock data could result in inappropriate adjustments in the amount of financial support provided to a sector. For an industry which is more capital-intensive than was previously thought, for example, more financing may be required given the greater need for capital in the production process. Correspondingly, the more capital-intensive industry would have more assets to serve as collateral and would be a better credit risk. Conversely, for an industry that is less capital-intensive than was previously thought, there might be less demand for funds and less collateral.

The lower capital stock and shorter service life estimates in some industries have significantly altered our views of capital intensity. The Capital and Repair Expenditures Survey has shown that service lives were particularly overstated in the paper and allied products industry (building and engineering construction), chemical products industry (engineering construction), grain elevators (building construction) and telephone industries (engineering construction).

Leasing by Industry

To get a true picture of industry inputs and outputs, it is important to allocate capital stock to the industry where it is actually used in production, rather than to the industry that owns the asset.

This is an important issue for Statistics Canada because leased capital is attributed to the owner of the asset, not the user. While this classification is appropriate when analyzing the distribution of wealth, it is not appropriate in estimating production functions and measuring productivity when the owner and the user of a leased asset are in different industries. For these purposes, it is desirable to classify the assets by use.

Intensité de capital par branche d'activité

Des estimations précises du stock de capital sont nécessaires pour déterminer les besoins en investissements des différents secteurs d'activité.

Les données sur le stock de capital peuvent être utilisées en conjonction avec les renseignements sur le coût du capital et le coût du travail dans divers secteurs d'activité afin de déterminer quelles branches offrent le plus grand potentiel économique. À titre d'exemple, le Canada, par comparaison aux pays sous-développés, a un coût relativement bas du capital et des coûts du travail élevés, et a donc tendance à se spécialiser dans les branches à intensité de capital, plutôt qu'à intensité de travail.

Aux fins de la politique fiscale, les estimations du stock de capital par branche d'activité fournissent également des renseignements utiles pour déterminer le coût et le besoin des crédits d'impôt à l'investissement. Il est ainsi possible d'identifier les branches à intensité de capital, qui ont besoin de plus d'investissements en immobilisations et qui peuvent avoir besoin d'une aide sous la forme de crédits d'impôt à l'investissement.

De plus, les estimations du stock de capital sont utiles pour les institutions financières lorsqu'elles veulent obtenir une évaluation globale du besoin de financement des différents secteurs d'activité de l'économie. Des données erronées du stock de capital peuvent se traduire par des corrections inadéquates du soutien financier fourni à un secteur. Dans le cas d'une branche dont l'intensité de capital est plus grande qu'on ne le pensait auparavant, par exemple, il faudrait accroître davantage peut-être le financement en raison du besoin plus grand de capital pour la production. Réciproquement, la branche d'activité qui a une plus grande intensité de capital aurait plus d'actifs pour servir de nantissement et offrirait un risque de crédit plus bas. Inversement, une branche d'activité dont l'intensité de capital n'est pas aussi grande qu'on ne le pensait précédemment, par exemple, nécessiterait moins de financement et moins de nantissement.

Les estimations plus basses du stock de capital et d'une durée de vie utile plus courte dans certaines branches d'activité ont sensiblement modifié notre perception de l'intensité de capital. L'Enquête sur les dépenses en immobilisations et réparations a montré que les durées de vie utile étaient particulièrement surestimées dans la branche du papier et produits connexes (bâtiments et travaux de génie), celle des produits chimiques (travaux de génie), celle des silos à céréales (bâtiments) et des services téléphoniques (travaux de génie).

Crédit-bail par branche d'activité

Afin d'avoir une image réelle des facteurs et des produits d'une branche d'activité, il est important d'affecter le stock de capital à la branche d'activité où il est utilisé lors du processus de production, plutôt qu'à celle qui possède l'actif.

C'est une question importante pour Statistique Canada, puisque le capital loué est attribué au propriétaire de l'actif, et non pas à l'utilisateur. Bien que cette classification convienne lorsqu'il s'agit d'analyser la répartition de la richesse, elle ne convient pas dans l'estimation des fonctions de production et des mesures de productivité, lorsque le propriétaire et l'utilisateur d'un actif loué se trouvent dans des branches différentes. À ces fins, il est souhaitable de classer les actifs selon l'utilisation.

In the absence of information on leased capital, capital stock would be overstated in industries that tend to be lessors, thereby resulting in understated productivity and overstated capacity. Conversely, productivity would be overstated and capacity understated for those industries that make the greatest use of leased equipment.

By directly asking establishments to report expenditures on assets for lease to and from others, the Capital and Repair Expenditures Survey is able to identify those industries for which leasing activities represent a significant proportion of their total capital stock. Work is currently well underway to allocate capital assets to the industry of use and thus to provide better estimates of the stock of capital actually available for use by industry.

Industries that tend to lease equipment include service industries, such as finance, insurance, real estate and business services. Industries that make the greatest use of leased equipment are construction, forestry, transportation, clothing, wholesale trade, and beverages.

Pollution Abatement by Industry

Environmental objectives are becoming increasingly important for public policy. Legislation relating to pollution abatement and control has become more important in recent years, and firms are spending a significant share of their capital budget on assets designed to control pollution. The Capital and Repair Expenditure Survey now directly asks respondents in all industries to record the proportion of spending on pollution abatement relative to total capital asset expenditures.

Such information is important in measuring the cost of pollution control. Cost-benefit analysis, which is essential for rational policy-making, requires reliable information on both the costs and benefits of reduced pollution to the extent that they are measurable. Periodic data on pollution control also allow policy-makers regularly to monitor changes over time in the stock of pollution abatement and control capital. This is imperative to assess the effectiveness of environmental legislation and regulations.

In addition, information on pollution abatement expenditures allows the examination of the impact of pollution abatement standards on the costs and competitiveness of particular industries. For certain industries such as pulp and paper, chemicals, petroleum, and primary metals, pollution abatement and control capital expenditures represent an important portion of total capital expenditures.

For these industries, it is particularly important to exclude these assets from total capital expenditures to measure accurately productivity and capacity utilization. Given that output measures do not reflect the welfare gains implicit in

En l'absence de renseignements sur le capital loué, le stock de capital serait surestimé dans les branches d'activité qui ont tendance à être des loueurs, ce qui se traduirait donc par une productivité sous-estimée et une capacité surestimée, puisque la quantité de capital réellement mise à la disposition des entrepreneurs de la branche d'activité est moins élevée. Inversement, la productivité serait surestimée et la capacité, sous-estimée, dans les branches d'activité qui utilisent le plus le matériel loué.

En demandant directement aux établissements de déclarer les dépenses au titre des actifs destinés au crédit-bail pour d'autres et en provenance de ceux-ci, l'Enquête sur les dépenses en immobilisations et réparations est en mesure d'identifier les branches d'activité pour lesquelles les activités de crédit-bail constituent une proportion appréciable de leur stock de capital total. Les travaux d'affectation des actifs de nature capitale à la branche d'utilisation sont actuellement bien avancés, ce qui permettra de fournir de meilleures estimations du stock de capital réellement utilisé par la branche d'activité.

Les branches qui ont tendance à louer le matériel comprennent les branches des services comme celles des finances, de l'assurance, des affaires immobilières et des services commerciaux. Les branches qui utilisent le plus le matériel à crédit-bail sont celles de la construction, des forêts, des transports, de l'habillement ainsi que du commerce de gros et des boissons.

Réduction de la pollution par branche d'activité

Les objectifs environnementaux prennent de plus en plus d'importance aux fins de la politique publique. La législation régissant la réduction de la pollution et son contrôle ont pris plus d'importance au cours des dernières années, et les entreprises dépensent une partie appréciable de leur budget d'investissement au titre des actifs destinés à la réduire. L'Enquête sur les dépenses en immobilisations et en réparations demande directement aux répondants de toutes les branches d'activité de déclarer la proportion des dépenses consacrées à la réduction de la pollution par rapport au total des dépenses en immobilisations.

De tels renseignements sont importants lorsqu'il s'agit de mesurer le coût du contrôle de la pollution. L'analyse avantages-coûts, qui est essentielle pour la détermination de politiques rationnelles, exige des renseignements fiables sur les coûts et les avantages de la réduction de la pollution, dans la mesure où ils sont mesurables. Des données fiables sur le contrôle de la pollution permettent également aux décideurs de suivre régulièrement les variations dans le temps du stock de capital de réduction et de lutte contre la pollution. De telles mesures sont essentielles si l'on veut évaluer l'efficacité de la législation et de la réglementation environnementales.

De plus, les renseignements sur les dépenses au titre de la réduction de la pollution permettent d'étudier l'impact des normes de réduction de pollution sur les coûts et la compétitivité des diverses branches d'activité. Dans certaines, comme celle des pâtes et papiers, des produits chimiques, du pétrole et de la première transformation des métaux, les dépenses au titre de la réduction et du contrôle de la pollution constituent une partie importante du total des dépenses en immobilisations.

Pour ces branches d'activité, il est particulièrement important d'exclure ces actifs du total des dépenses en immobilisations afin de mesurer avec précision la productivité et l'utilisation de la capacité. Étant donné que des mesures de la production ne traduisent

environmental protection and that pollution abatement spending does not necessarily add to productive capacity, productivity and capacity utilization estimates could be understated in the absence of this adjustment.

A complication revealed by the survey is that it is not always possible to separate spending on pollution abatement from other capital expenditures. Often newer, more productive equipment embodies better pollution abatement technology.

pas les gains de bien-être qui sont implicites dans la production environnementale et comme les dépenses au titre de la réduction de la pollution ne s'ajoutent pas nécessairement à la capacité productive, les estimations de la productivité et de l'utilisation de la capacité pourraient être sous-estimées en l'absence d'une telle correction.

Une complication que l'enquête a mise en évidence est qu'il n'est pas toujours possible de distinguer les dépenses au titre de la réduction de la pollution des autres dépenses en immobilisations. Souvent un matériel plus neuf, plus productif, incorpore une meilleure technologie pour réduire la pollution.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Fishing and trapping industries
Industries de la pêche et du piégeage

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Fishing and trapping industries
Industries de la pêche et du piégeage

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Mining (including Milling), quarrying and oil well industries
Industries des mines (y compris broyage), carrières et puits de pétrole

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Mining industries
Industries des mines

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Non-metal mines
Mines de minerais non métalliques

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisionnelles et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Crude petroleum and natural gas industries
Industries du pétrole brut et du gaz naturel

footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Total manufacturing industries
Ensemble des industries manufacturières

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Beverage industries
Industries des boissons

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Rubber products industries
Industries des produits en caoutchouc

Year Année	Gross Fixed Capital Formation	End-Year Gross Stock	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation	End-Year Gross Stock	End-Year Net Stock Stock net de fin d'année			Service Life - Durée de vie	Average Age - Âge moyen

or footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Leather and allied products industries
Industries du cuir et des produits connexes

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Textile products industries

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Primary metal industries
Industries de première transformation des métaux

Year Année	Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brute de fin d'année	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brut de fin d'année	End-Year Net Stock Stock net de fin d'année			Service Life - Durée de vie	Average Age - Âge moyen

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Primary metal industries
Industries de première transformation des métaux

Year Année	Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brute de fin d'année	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brut de fin d'année	End-Year Net Stock Stock net de fin d'année			Service Life - Durée de vie	Average Age - Age moyen
			Geometric Depreciation - Amortis- sement géométrique	Straight-Line Depreciation - Amortis- sement linéaire	Delayed Depreciation - Amortis- sement différé			Geometric Depreciation - Amortis- sement géométrique	Straight-Line Depreciation - Amortis- sement linéaire	Delayed Depreciation - Amortis- sement différé

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisionnelles et projetées.

Machinery industries
Industries de la machinerie

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Non-metallic mineral products industries
Industries des produits minéraux non métalliques

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernière années sont dérivées à partir de dépenses provisoires et projetées.

Refined petroleum and coal products industries
Industries des produits raffinés du pétrole et du charbon

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Transportation and storage industries

Industries du transport et de l'entreposage

Year Année	Gross Fixed Capital Formation -	End-Year Gross Stock -	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation -	End-Year Gross Stock -	End-Year Net Stock Stock net de fin d'année			Service Life -	Average Age -

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Transportation industries
Industries du transport

or footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Air transport and related service industries
Industries du transport aérien et de services connexes

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Railway transport and related service industries

Industries du transport et des services ferroviaires

or footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

he estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

les données relatives aux deux dernières années sont dérivées à partir de dépenses provisionnaires et projetées.

Water transport and related service industries
Industries du transport par eau et de services connexes

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Truck transport industries
Industries du camionnage

footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Pipeline transport industries
Industries du transport par pipelines

footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Communication and other utility industries
Industries des communications et autres services publics

Year - Année	Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brute de fin d'année	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brut de fin d'année	End-Year Net Stock Stock net de fin d'année			Service Life - Durée de vie	Averag Age - Age moyen

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

or footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Telecommunication broadcasting industries
Industries de la diffusion des télécommunications

Year - Année	Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brute de fin d'année	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brut de fin d'année	End-Year Net Stock Stock net de fin d'année			Service Life - Durée de vie	Average Age - Age moyen

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Telecommunication carriers and other telecommunication industries
Industries de la transmission des télécommunications et autres industries de télécommunications

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Gas distribution systems industry
Industrie de la distribution de gaz

Year Année	Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brute de fin d'année	End-Year Net Stock Stock net de fin d'année			Gross Fixed Capital Formation - Formation brute de capital fixe	End-Year Gross Stock - Stock brut de fin d'année	End-Year Net Stock Stock net de fin d'année			Service Life - Durée de vie	Average Age - Âge moyen

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Other utility industries n.e.c.
Autres industries de services publics n.c.a.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernière années sont dérivées à partir de dépenses provisoires et projetées.

Wholesale trade industries
Industries du commerce de gros

footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Finance and insurance industries
Industries des intermédiaires financiers et des assurances

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Note(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Government service industries
Industries des services gouvernementaux

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

federal government service industries
industries des services de l'administration fédérale

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Provincial and territorial government service industries
Industries des services des administrations provinciales et territoriales

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Local government service industries

(Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Elementary and secondary education

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

post-secondary non-university education
 enseignement postsecondaire non universitaire

Footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

Estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Total All Industries, Nova Scotia
Ensemble des industries, Nouvelle-Écosse

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fine des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

See footnote(s) at end of tables. Voir notes à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernière années sont dérivées à partir de dépenses provisoires et projetées.

1992	124.1	121.7	121.8	87.3	108.0
1993	125.3	124.2	124.3	80.9	106.3
1994	124.7	127.1	127.0	77.0	106.6

For footnote(s), see end of tables. Voir note(s) à la fin des tableaux.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

Price Indexes for Capital Expenditures on Construction, and Machinery and Equipment, by Industry
Indices des prix des immobilisations en construction et en machines et outillage, par industrie

Year - Année	Construction			Machinery and Equipment - Machines et outillage	Total Components (Implicit) - L'ensemble des éléments (implicite)
	Building Construction - Bâtiment	Engineering Construction - Travaux de génie	Total Construction (Implicit) - L'ensemble de la construction (implicite)		
(1986 = 100)

THE MARKET RESEARCH HANDBOOK 1993/1994

1991 CENSUS INCLUDED

The fastest way to get off to a good start !

Brainstorming with your colleagues produces some great marketing ideas. But which ones will you use? The **Market Research Handbook** can help you narrow your options before you commit any more time and resources to developing your strategy.

This handbook is the most comprehensive statistical compendium on Canadian consumers and the businesses that serve them. It helps you to identify, define and locate your target markets.

Looking for...

... socio-economic and demographic profiles of 45 urban areas?

... revenue and expenditure data for retailers and small businesses?

The **Market Research Handbook** has it all... and more. It provides information on:

- 1991 Census information
- personal expenditures on goods and services
- size and composition of households and families
- wages, salaries and employment
- investment in Canadian industries
- labour force in various industries
- industry and consumer prices

It has been one of our bestsellers since 1977 for the simple reason that it offers such a range and depth of market data. Save time and money when you're looking for data or data sources, keep the **Market Research Handbook** close at hand for easy reference.

The **Market Research Handbook** (Cat. no. 63-224) is \$94 (plus 7 % GST) in Canada, US\$113 in the United States and US\$132 in other countries.

To order, write to Statistics Canada, Marketing Division, Publication Sales, Ottawa, Ontario, K1A 0T6 or contact the nearest Statistics Canada Reference Centre listed in this publication.

If more convenient, fax your order to (613) 951-1584. Or call toll-free 1-800-267-6677 and use your VISA or MasterCard.

LE RECUEIL STATISTIQUE DES ÉTUDES DE MARCHÉ 1993/1994

RECENSEMENT DE 1991

Pour partir du bon pied !

Des séances de remue-ménings jaillissent d'excellentes idées de commercialisation. Mais lesquelles choisir ? Le **Recueil statistique des études de marché** peut vous faciliter les choix avant que vous n'engagiez plus de temps et de ressources à l'élaboration de votre stratégie.

Ce recueil statistique est le plus exhaustif qui soit sur les consommateurs canadiens et les entreprises qui les servent. Il vous aide à définir et situer vos marchés cibles.

Vous cherchez...

... des profils socio-économiques et démographiques de 45 régions urbaines ?

... des données sur les recettes et les dépenses de détaillants et de petites entreprises ?

Le **Recueil** contient tout cela... et plus encore :

- données sur le recensement de 1991
- dépenses personnelles en biens et en services
- taille et composition des ménages et des familles
- traitements, salaires et emploi
- investissements par secteur d'activité économique
- population active par secteur d'activité
- prix de l'industrie et de la consommation

Si c'est l'un de nos succès depuis 1977, c'est parce qu'il vous renseigne en long et en large sur le marché. Pour économiser temps et argent, vous ne sauriez vous en passer.

Le **Recueil statistique des études de marché** (n° 63-224 au catalogue) coûte 94 \$ (plus 7 % de TPS) au Canada, 113 \$ US aux États-Unis et 132 \$ US dans les autres pays.

Pour commander, veuillez écrire à Statistique Canada, Division du marketing, Vente de publications, Ottawa (Ontario), K1A 0T6 ou communiquer avec le Centre de consultation de Statistique Canada le plus proche (voir la liste figurant dans la présente publication).

Vous pouvez également commander par télécopieur au (613) 951-1584 ou composer le 1-800-267-6677 et utiliser votre carte VISA ou MasterCard.

FIND OUT THE INSIDE STORY ON 25% OF THE LABOUR FORCE

Order your copy of **Public Sector Employment and Remuneration** today!

Uncovering the latest labour changes in the public sector can be tough. But now there's a publication to help.

Public Sector Employment and Remuneration 1992, (With Historical Data from 1988) gives you reliable data, consistent comparisons, and concise analysis on the changing levels of public sector employment.

This publication brings you all the facts! **Public Sector Employment and Remuneration 1992** provides you with the most up-to-date public sector employment statistics, including **for the first time, FULL COVERAGE OF THE PUBLIC SECTOR** and new **CENSUS METROPOLITAN AREA DATA** for federal and local governments.

This valuable working tool will help you to:

- Chart changes in public sector employment: nationally, provincially and locally.
- Make direct comparisons between employment levels: federal, provincial, inter-provincial, and municipal.

Don't miss this opportunity to get the information you need to understand where we are and make informed decisions about public sector employment strategies for the '90s.

Each copy of **Public Sector Employment and Remuneration** (Catalogue no. 72-2090XPB) costs only \$42 in Canada (plus GST), US\$51 in the United States and US\$59 in other countries.

To order, write to **Statistics Canada, Marketing Division, Sales and Service, 120 Parkdale Ave., Ottawa, Ontario K1A 0T6**, or contact the nearest Statistics Canada Reference Centre listed in this publication.

If more convenient, call toll-free **1-800-267-6677** and use your VISA or MasterCard. Or **fax** your order to **(613) 951-1584**.

DÉCOUVREZ LES FAITS RÉELS QUI TOUCHENT 25 % DE LA POPULATION ACTIVE

Commandez dès aujourd'hui votre exemplaire d' **Emploi et rémunération dans le secteur public**.

Il est parfois difficile de se tenir informé des derniers développements survenus dans le dossier de l'emploi. Heureusement, il existe maintenant une nouvelle publication pour combler cette lacune.

Emploi et rémunération dans le secteur public en 1992, (Avec les données historiques de 1988) fournit des données fiables, des comparaisons pertinentes et des analyses concises sur l'évolution du niveau d'emploi dans le secteur public.

Cette publication est une source de données factuelles. **Emploi et rémunération dans le secteur public en 1992** vous offre les statistiques les plus récentes sur l'emploi

dans le secteur public et, **pour la première fois, UNE COUVERTURE COMPLÈTE DU SECTEUR PUBLIC** et les nouvelles **DONNÉES SUR LES RÉGIONS MÉTROPOLITAINES DE RECENSEMENT** pour les administrations fédérale et locales.

Cet ouvrage de référence inestimable vous aidera à :

- représenter graphiquement l'emploi total dans le secteur public, à l'échelle nationale, provinciale et locale;
- établir des comparaisons directes entre les niveaux d'emploi dans les administrations fédérale, provinciales, interprovinciales et municipales.

Ne ratez pas l'occasion d'en savoir davantage sur la situation actuelle de l'emploi afin de pouvoir prendre des décisions éclairées sur les stratégies d'emploi à adopter pour le secteur public dans les années 1990.

Emploi et rémunération dans le secteur public en 1992 (n° 72-2090XPB au catalogue) est vendu seulement 42 \$ l'exemplaire au Canada (TPS en sus), 51 \$ US aux États-Unis et 59 \$ US dans les autres pays.

Pour commander, écrivez à : **Statistique Canada, Division du marketing, Vente et service, 120, av. Parkdale, Ottawa (Ontario) K1A 0T6** ou communiquez avec le Centre de consultation de Statistique Canada le plus proche (la liste figure dans la présente publication).

Vous pouvez également composer sans frais le **1-800-267-6677** et porter votre achat à votre carte VISA ou MasterCard. Il est aussi possible de passer votre commande par **télécopieur** au **(613) 951-1584**.

Do you really have time to monitor over 200 Trusteed Pension Funds?

You do - if you subscribe to **Quarterly Estimates of Trusteed Pension Funds**.

The only periodical of its kind in Canada, **Quarterly Estimates** surveys the 200 largest trusteed pension funds, which hold 85% of the assets of all trusteed funds. The result is timely, detailed and aggregate estimates of the income, expenditure and assets of approximately 3,000 funds operating in Canada.

Each issue gives you:

- current financial data for employee and employer contributions to the fund;
- investment income, profits and losses on sales of securities;
- pension payments and annuity purchases.

Distribution of investment portfolios among such vehicles as stocks, bonds, pooled funds and short term holdings is also highlighted. The accompanying analysis examines trends, growth and performance over time.

Get the numbers.

Subscribe to **Quarterly Estimates of Trusteed Pension Funds** (Catalogue No. 74-0010XPB) for the regular update you need.

A subscription to this quarterly is \$60 annually in Canada, US\$72 in the United States and US\$84 in other countries.

Avez-vous le temps de vous renseigner sur plus de 200 caisses de retraite en fiducie ?

Oui - si vous vous abonnez à **Estimations trimestrielles relatives aux caisses de retraite en fiducie**.

Ce périodique, unique en son genre au Canada, passe en revue la situation des 200 plus importantes caisses de retraite en fiducie, qui représentent 85 % de l'actif de l'ensemble des caisses de retraite. Le résultat prend la forme d'estimations à propos, détaillées et globales des recettes, des dépenses et de l'actif d'environ 3 000 caisses de retraite au Canada.

Chaque numéro vous présente :

- des données financières courantes relativement aux cotisations de l'employé et de l'employeur à la caisse de retraite;
- les revenus de placements ainsi que les profits et pertes sur les ventes de titres;
- les paiements des pensions et les achats de rentes.

Vous y trouverez également des renseignements sur la répartition des portefeuilles de placement entre les actions, les obligations, les fonds communs et les placements à court terme ainsi qu'une analyse des tendances, de la croissance et du rendement dans le temps.

Abonnez-vous!

La publication **Estimations trimestrielles relatives aux caisses de retraite en fiducie** (n° 74-0010XPB au catalogue) vous permet d'obtenir régulièrement les données à jour dont vous avez besoin. L'abonnement à cette publication trimestrielle coûte 60 \$ par année au Canada, 72 \$ US aux États-Unis et 84 \$ US dans les autres pays.

Pour commander, veuillez écrire à Statistique Canada, Division du marketing, Vente et service, 120, av. Parkdale, Ottawa (Ontario) K1A 0T6 ou communiquer avec le Centre de consultation de Statistique Canada le plus près (voir la liste figurant dans la présente publication).

THE 1994 CANADA YEAR BOOK

*Your indispensable and
comprehensive reference
source on Canada*

For essential information on Canada, turn to the *Canada Year Book*. An invaluable resource, the 1994 edition is beautifully designed in an inviting and easy-to-read format.

The 1994 *Canada Year Book* examines recent events, changes and trends in great detail. Organized carefully into 22 chapters, it answers questions on virtually every topic from geography through health to banking.

This edition features:

- ▶ Over 700 crisply written pages packed with eye-opening information on life in Canada — from social, economic, cultural and demographic perspectives
- ▶ 250 concise tables plus 63 charts and graphs that put statistical information into focus
- ▶ Stunning photographs capturing distinctively Canadian scenes by some of this country's finest photographers
- ▶ Fascinating short feature articles covering everything from archaeology to white collar trends

Trusted for over 125 years by students, teachers, researchers, librarians and business people, the *Canada Year Book* is the reference source to consult first on all aspects of Canada.

An enduring addition to any home or office library!

ORDER YOUR COPY OF CANADA YEAR BOOK TODAY.

Available in separate English and French editions, the 1994 *Canada Year Book* (Catalogue No. 11-402E) is \$59.95 plus \$5.05 shipping and handling in Canada, US \$72 in the United States, and US \$84 in other countries.

To order, write to: Statistics Canada, Marketing Division, Sales and Service, Ottawa, Ontario K1A 0T6, or contact the nearest Statistics Canada Regional Reference Centre listed in this publication.

If more convenient, fax your order to 1-613-951-1584 or call toll-free 1-800-267-6677 and charge it to your VISA or MasterCard.

L'ANNUAIRE DU CANADA 1994

*Un ouvrage complet et
indispensable sur le Canada*

Pour obtenir des renseignements essentiels sur le Canada, consultez *l'Annuaire du Canada*. Inestimable source d'information, l'édition de 1994 est un ouvrage d'une présentation très soignée, attrayant et facile à lire.

L'Annuaire du Canada 1994 étudie en profondeur les événements, les tendances et les changements récents. Divisé en 22 chapitres, il répond à vos questions sur presque tous les sujets, depuis la géographie jusqu'à la santé et la banque.

Voici ce que vous trouverez dans l'édition de 1994 :

- ▶ Plus de 700 pages écrites dans un style vif et pleines de renseignements intéressants sur les dimensions sociales, économiques, culturelles et démographiques de la vie canadienne
- ▶ 250 tableaux concis et 63 graphiques et diagrammes qui permettent de mettre en perspective l'information statistique
- ▶ Remarquables photographies de paysages typiquement canadiens par certains des photographes canadiens les plus illustres
- ▶ Courts articles fascinants sur des sujets divers, depuis l'archéologie jusqu'à l'évolution de la situation des cols blancs

Ouvrage de référence de prédilection des étudiants, des enseignants, des chercheurs, des bibliothécaires et des gens d'affaires, et ce depuis plus de 125 ans, *l'Annuaire du Canada* est celui qu'il faut consulter en premier pour en savoir plus long sur tous les aspects du Canada.

Un volume que vous voudrez conserver longtemps dans votre bibliothèque ou au bureau!

CANADA A PORTRAIT

A CELEBRATION
OF OUR GREAT NATION

Canada challenges the imagination. Imagine a country where Newfoundlanders live closer to Africans than they do to fellow Canadians in British Columbia. Or a country with an island that has a glacier bigger than Ireland. Imagine a country with two million lakes, and the world's longest coastline – but that shares a border with only one nation.

Statistics Canada has created the 54th edition of **Canada: A Portrait** as a celebration of our great nation. Drawn from Statistics Canada's rich palette of national data, it paints a picture of where we are socially, economically, culturally and politically.

Over 60 unique and beautiful photographs combined with lively text, provide a close-up look at the Canada of today.

Experience this land's remarkable natural regions and diverse human landscape through six chapters entitled: **This Land, The People, The Society, Arts and Leisure, The Economy, and Canada in the World.**

Eminent Canadians such as astronaut Roberta Bondar, former hockey star Jean Béliveau, and writer W.O. Mitchell have contributed their personal visions of Canada.

Canada: A Portrait is a beautiful illustration of the Canada of today.

Presented in a 30 cm X 23 cm (12 1/4" X 9") format, prestige hardcover, with over 200 pages, **Canada: A Portrait** (Catalogue No. 11-403E) is available in Canada for \$38.00 plus GST, US \$41.95 in the United States, and US \$48.95 in other countries.

To order write **Statistics Canada, Publications Sales, Ottawa, Ontario, K1A 0T6** or contact the nearest Statistics Canada Regional Reference Centre listed in this publication. For faster ordering call toll-free **1-800-267-6677** and use your VISA and MasterCard or fax your order to **(613) 951-1584**.

UN PORTRAIT DU CANADA

POUR CÉLÉBRER LA
GRANDEUR DE NOTRE PAYS

Le Canada est un pays qui défie l'imagination. Imaginez un pays où les Terre-Neuviens vivent plus près des Africains que de leurs compatriotes de la Colombie-Britannique. Un pays où se trouve une île sur laquelle s'étend un glacier plus grand que l'Irlande. Imaginez un pays qui compte 2 millions de lacs et le plus long littoral du monde, et pourtant un seul voisin.

Statistique Canada a créé la 54^e édition d'**Un portrait du Canada** pour célébrer la grandeur de notre pays. C'est à partir du riche éventail de données nationales de Statistique Canada que l'on a brossé ce tableau de notre situation sociale, économique, culturelle et politique.

Plus de 60 magnifiques photos, mariées à un texte vivant, offrent une vision claire et détaillée de ce qu'est le Canada d'aujourd'hui.

Découvrez les splendides régions naturelles de ce pays, de même que son paysage humain des plus diversifiés, à travers six chapitres intitulés :

Le territoire, La population, La société, Les arts et les loisirs, L'économie et Le Canada dans le monde.

D'éminents Canadiens, tels Roberta Bondar, astronaute, Jean Béliveau, ancienne vedette de hockey, et W.O. Mitchell, écrivain, y font part de leur vision personnelle du Canada.

Un portrait du Canada... un magnifique ouvrage de collection qui décrit admirablement bien le Canada d'aujourd'hui.

Présenté dans un format de 30 cm sur 23 cm (12,25 po X 9 po), dans une couverture rigide de luxe et en plus de 200 pages, **Un portrait du Canada** (N° 11-403F au catalogue) coûte 38 \$ plus TPS au Canada, 41,95 \$ US aux États-Unis et 48,95 \$ US dans les autres pays.

Pour commander, écrivez à **Statistique Canada, Vente des publications, Ottawa (Ontario), K1A 0T6** ou communiquez avec le Centre régional de consultation de Statistique Canada le plus proche. La liste figure dans la publication. Pour commander plus rapidement, composez sans frais le **1-800-267-6677** et utilisez votre carte VISA ou MasterCard ou télécopiez votre commande au **(613) 951-1584**.
